

Scala

Data Structures

Data Structures

- Array
 - Sequential
 - Fixed Size
- List
 - Sequential
- Map
 - Key-Value Store

Array

- Sequential
 - One continuous block of memory
 - Random access based on memory address
 - $\text{address} = \text{first_address} + (\text{element_size} * \text{index})$
- Fixed Size

Array

```
def arrayMethods(): Unit = {  
  // Create new Array of Ints  
  val arr: Array[Int] = Array(2, 3, 4)  
  
  // Change a value by index  
  arr(1) = 20  
  
  // Access a value by index  
  val x: Int = arr(1)  
  
  // Iterate over elements  
  for (element <- arr) {  
    println(element)  
  }  
  
  // Iterate over indices  
  for (index <- 0 to (arr.length - 1)) {  
    println(index)  
  }  
  
  // Iterate over indices - alternate  
  for (index <- arr.indices) {  
    println(index)  
  }  
}
```

List

- Sequential
 - Spread across memory
 - Each element knows the memory address of the next element
 - Follow the addresses to find each element
- Variable Size
- Values cannot change [In Scala]

List

```
def listMethods(): Unit = {  
  // Create new Array of Int  
  var list: List[Int] = List(2, 3, 4)  
  
  // Access the first element  
  val x: Int = list.head  
  
  // Access a value by position  
  val y: Int = list.apply(1)  
  val z: Int = list(1)  
  
  // Add an element to the end of the list (append)  
  list = list :+ 50  
  
  // Add an element to the beginning of the list (prepend)  
  list = 70 :: list  
  
  // Iteration  
  for(element <- list){  
    println(element)  
  }  
}
```

Map

- Key-Value Store
 - Values stored at keys instead of indices
 - Multiple different implementations
 - Default is HashMap (CSE250 topic)
- Variable Size
- Variable Values
- Cannot have duplicate keys

Map

```
def mapMethods(): Unit = {  
  // Create new Map of Ints to Ints  
  var myMap: Map[Int, Int] = Map(2 -> 4, 3 -> 9, 4 -> 16)  
  
  // Add a key-value pair  
  myMap = myMap + (5 -> 25)  
  
  // Access a value by key (Crashes if key not in map)  
  val x: Int = myMap(3)  
  
  // Access a value by key with default value if key not in map  
  val y: Int = myMap.getOrElse(100, -1)  
  
  // Iteration  
  for((key, value) <- myMap){  
    println("value " + value + " stored at key " + key)  
  }  
}
```
