# Inheritance With Comparators

#### Side Note

- Methods can take generic types
- This method compares two LinkedListNodes of any type
- T will be replaced with the type of the lists given as arguments

```
public <T> void compareLinkedLists(LinkedListNode<T> l1, LinkedListNode<T> l2) {
   if(!(l1 == null && l2 == null)){
      assertTrue("l1 was null, but l2 was not", l1 != null);
      assertTrue("l2 was null, but l1 was not", l2 != null);
      assertEquals("node values are not equal", l1.getValue(), l2.getValue());
      compareLinkedLists(l1.getNext(), l2.getNext());
}
```

#### The Problem:

- Need to compare 2 values
- Determine which of the 2 values comes first in sorted order
- Use the comparator to sort any number of values

#### The Solution:

Use a comparator

- A comparator takes 2 parameters and returns information about the order of the two inputs
- Comparators come it 2 primary styles:
  - Returns an int
    - Negative if the first input comes before the second
    - Positive if the second input comes before the first
    - 0 if the order is tied
  - Returns a boolean
    - True if the first input comes before the second
    - False otherwise Including ties

#### Returns an int

- Many Java classes contain a compareTo method
- This method returns an int depending on the order of the inputs
  - If the calling object (this) comes before the argument -> a negative int
  - If the calling object (this) comes after the argument -> a positive int
  - If the the order is tied -> 0
- Common for the ints to be -1 and 1, but not guaranteed in all cases

```
String one = "a";
String two = "b";
System.out.println(one.compareTo(two));
System.out.println(one.compareTo(one));
System.out.println(two.compareTo(one));
```

- For Strings, comparisons are made alphabetically
  - Compare each character of both Strings starting with the first
    - If the characters are different, the String with the character that comes first in the alphabet is determined to come first in the ordering
    - If the characters are the same, check the next characters
    - If the end of one String is reached, that String comes first
- compareTo checks the case of each character!
  - All lowercase letter come after all capital letters ("Z" comes before "a")!

```
String one = "a";
String two = "b";
System.out.println(one.compareTo(two));
System.out.println(one.compareTo(one));
System.out.println(two.compareTo(one));
```

#### Returns a boolean

Our example in class will return a boolean

- Take 2 parameters
- Return true if the first parameter comes first
- Return false otherwise including ties

## Writing Comparators

Our example in class will return a boolean

- This method will compare ints in decreasing order
  - return true when a > b (a comes before b)
  - false otherwise including a == b

```
public boolean compare(int a, int b) {
   return a > b;
}
```

- We'll wrap this method in a class
- Note that the compare method is not static
  - Need to create an object of this type to call the method

 Ok.. hey, wait.. there's no constructor! How we gonna create an object?

```
public class IntDecreasing {
   public boolean compare(int a, int b) {
     return a > b;
   }
}
```

#### Default Constructor

- If you don't write a constructor, you automatically get the default constructor
  - The default constructor takes no parameters and has no code in it's body
- These two classes are functionally identical

```
public class IntDecreasing {
  public IntDecreasing(){}
  public boolean compare(int a, int b) {
    return a > b;
  }
}

public class IntDecreasing {
  public boolean compare(int a, int b) {
    return a > b;
  }
}
```

And we'll use inheritance!

- Write a Comparator class that takes a generic type
- Extend this class with a specific type
- Since we're switching to generics, we change int to Integer

```
public class Comparator<T> {
   public boolean compare(T a, T b) {
      return false;
   }
}

public class IntDecreasing extends Comparator<Integer> {
   @Override
   public boolean compare(Integer a, Integer b) {
      return a > b;
   }
}
```

 The comparator class defines a stubbed out compare method that always returns false

Our IntDecreasing class overrides compare

```
public class Comparator<T> {
   public boolean compare(T a, T b) {
      return false;
   }
}

public class IntDecreasing extends Comparator<Integer> {
   @Override
   public boolean compare(Integer a, Integer b) {
      return a > b;
   }
}
```

- We can extend this comparator to compare any type in any way
- This comparator compares Gameltems based on their distance from (0, 0)
- We'll stick with the int comparator for lecture to keep things simpler

```
public class Comparator<T> {
   public boolean compare(T a, T b) {
     return false;
   }
}
```

```
public class DistanceFromOrigin extends Comparator<GameItem> {
    private double distance(GameItem item){
        return Math.sqrt(Math.pow(item.getX(), 2.0) + Math.pow(item.getY(), 2.0));
    }
    @Override
    public boolean compare(GameItem a, GameItem b) {
        return distance(a) < distance(b);
    }
}</pre>
```

- We have comparators now, but how do we use them?
- We want to sort any number of values
  - How do we do this when we can only compare 2 values?

```
public class IntDecreasing extends Comparator<Integer> {
    @Override
    public boolean compare(Integer a, Integer b) {
        return a > b;
    }
}
```

```
public class DistanceFromOrigin extends Comparator<GameItem> {
    private double distance(GameItem item){
        return Math.sqrt(Math.pow(item.getX(), 2.0) + Math.pow(item.getY(), 2.0));
    }
    @Override
    public boolean compare(GameItem a, GameItem b) {
        return distance(a) < distance(b);
    }
}</pre>
```

- Insertion sort:
  - For each value in the list to be sorted
    - Find where that value belongs in the output list
    - Insert the value at the location

input: [1 6 5]

output:

- The first element is copied to the output list
- No decision to make since the output is empty

```
input: [1 6 5]

↑

output: [1]

↑
```

- Find where 6 is inserted
- Compare 1 and 6 using our comparator
  - The comparator returns false since 1 does not come before 6 (Remember we're sorting in reverse order)
- Insert 6 before 1

```
input: [1 6 5]

output: [6 1]
```

- Find where 5 is inserted
- Compare 6 and 5 using our comparator
  - The comparator returns true so we advance to the next element
- Compare 1 and 5 using our comparator
  - The comparator return false. This is where we insert

```
input: [1 6 5]

•

output: [6 5 1]

•
```

```
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
     for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

 Let's look through the code for insertion sort using our comparator

```
public class Sorter<T> {
 Comparator<T> comparator;
 public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
 public ArrayList<T> sort(ArrayList<T> input) {
   ArrayList<T> output = new ArrayList<>();
   for (T valueToInsert : input) {
      int location = 0;
     for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
 public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

- The Sort class will take a generic type
  - We write sorting code 1 time ever and use it to sort any type

- The Sort constructor takes and stores a Comparator
  - We write sorting code 1 time ever and use it to sort type in any order

```
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
 public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

- Write a sort method that will take an ArrayList as an input
- Return a new ArrayList with the same values, but in sorted order

- The input is passed by reference
  - Any change made to the input ArrayList will change the state of the heap
  - This change will be seen outside your method
- Must be careful when handling parameters that are references

```
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) -
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

- For each element in the input ArrayList:
  - Find the index in the output where it should be inserted

- Call the comparator to compare each value in the output with the value being inserted
- Count the number of times compare returned true
  - This is the number of elements that come before this value
  - This is the index where the value should be inserted

```
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
     for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

- To create an object of type Sort:
  - Call the constructor with a Comparator as the argument

```
new Sort<>(new IntDecreasing())
```

- Wait. What?
  - IntDecreasing != Comparator
  - Is that allowed?

```
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
        if (comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
    Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

- IntDecreasing != Comparator
- Is that allowed?

- Yes. Yes it is!
- It's allowed because IntDecreasing extends
  Comparator
- This is polymorphism
  - Much more discussion about this later in the course
  - For now, this is allowed and we'll use it to sort using any type that extends Comparator

## Diagram Memory

Get it.. because the words are sorted.....

```
public class Comparator<T> {
 public boolean compare(T a, T b) {
    return false;
public class IntDecreasing extends Comparator<Integer> {
 @Override
 public boolean compare(Integer a, Integer b) {
    return a > b;
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
    this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
        if (this.comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

Stack		Heap
Name	Value	ПСар
		<u>in/out</u>

- We need to create a new Sorter:
  - When calling any method, need to resolve the arguments first

```
public class Comparator<T> {
 public boolean compare(T a, T b) {
    return false;
public class IntDecreasing extends Comparator<Integer> {
 @Override
 public boolean compare(Integer a, Integer b) {
   return a > b;
public class Sorter<T> {
 Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
   this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
    ArrayList<T> output = new ArrayList<>();
    for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
        if (this.comparator.compare(valueToCompare, valueToInsert)) {
          location++;
      output.add(location, valueToInsert);
    return output;
  public static void main(String[] args) {
Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
    ArrayList<Integer> output = sorter.sort(list);
    System.out.println(output);
```

Stack		Heap	
Name	V	alue	Πσαρ
			<u>in/out</u>
			<u>III/Oat</u>

- The argument is another constructor call
- That constructor must resolve before calling Sorter

```
Stack
public class Comparator<T> {
                                                                                                                     Heap
 public boolean compare(T a, T b) {
                                                                                                    Value
                                                                                       Name
   return false;
                                                                                          sorter
                                                                                                                  IntDecreasing
                                                                     IntDecreasing
                                                                                                 0x350
                                                                                            this
                                                                      Comparator
                                                                                            this
                                                                                                 0x350
public class IntDecreasing extends Comparator<Integer> {
                                                                                                                   0x350
 @Override
 public boolean compare(Integer a, Integer b) {
   return a > b;
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
   this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
   ArrayList<T> output = new ArrayList<>();
   for (T valueToInsert : input) {
      int location = 0;
      for (T valueToCompare : output) {
       if (this.comparator.compare(valueToCompare, valueToInsert)) {
          location++;
     output.add(location, valueToInsert);
                                                                                                                      in/out
    return output;
  public static void main(String[] args) {
Sorter<Integer> sorter = new Sorter<>(new IntDecreasing());
                                                                           IntDecreasing has no constructor in the code
    ArrayList<Integer> list = new ArrayList<>(Arrays.asList(1, 6, 5));
   ArrayList<Integer> output = sorter.sort(list);
   System.out.println(output);
                                                                             Call the default constructor
```

```
Stack
public class Comparator<T> {
                                                                                                                     Heap
 public boolean compare(T a, T b) {
                                                                                                   Value
                                                                                       Name
   return false;
                                                                                          sorter
                                                                                                                  IntDecreasing
                                                                    IntDecreasing
                                                                                                 0x350
                                                                                            this
                                                                      Comparator
                                                                                            this
                                                                                                 0x350
public class IntDecreasing extends Comparator<Integer> {
                                                                                                                   0x350
 @Override
 public boolean compare(Integer a, Integer b) {
   return a > b;
public class Sorter<T> {
  Comparator<T> comparator;
  public Sorter(Comparator<T> comparator){
   this.comparator = comparator;
  public ArrayList<T> sort(ArrayList<T> input) {
   ArrayList<T> output = new ArrayList<>();
   for (T valueToInsert : input) {
      int location = 0;
