Classes: Part 2

Memory

Diagram

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

Stack

Name	Value

Heap

in/out

- We'll trace this version of the code
- Set up the stack, heap, and in/out

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

Stack

Name	Value

Heap

in/out

- New objects are created on the heap

- Only a reference is stored in variables

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```
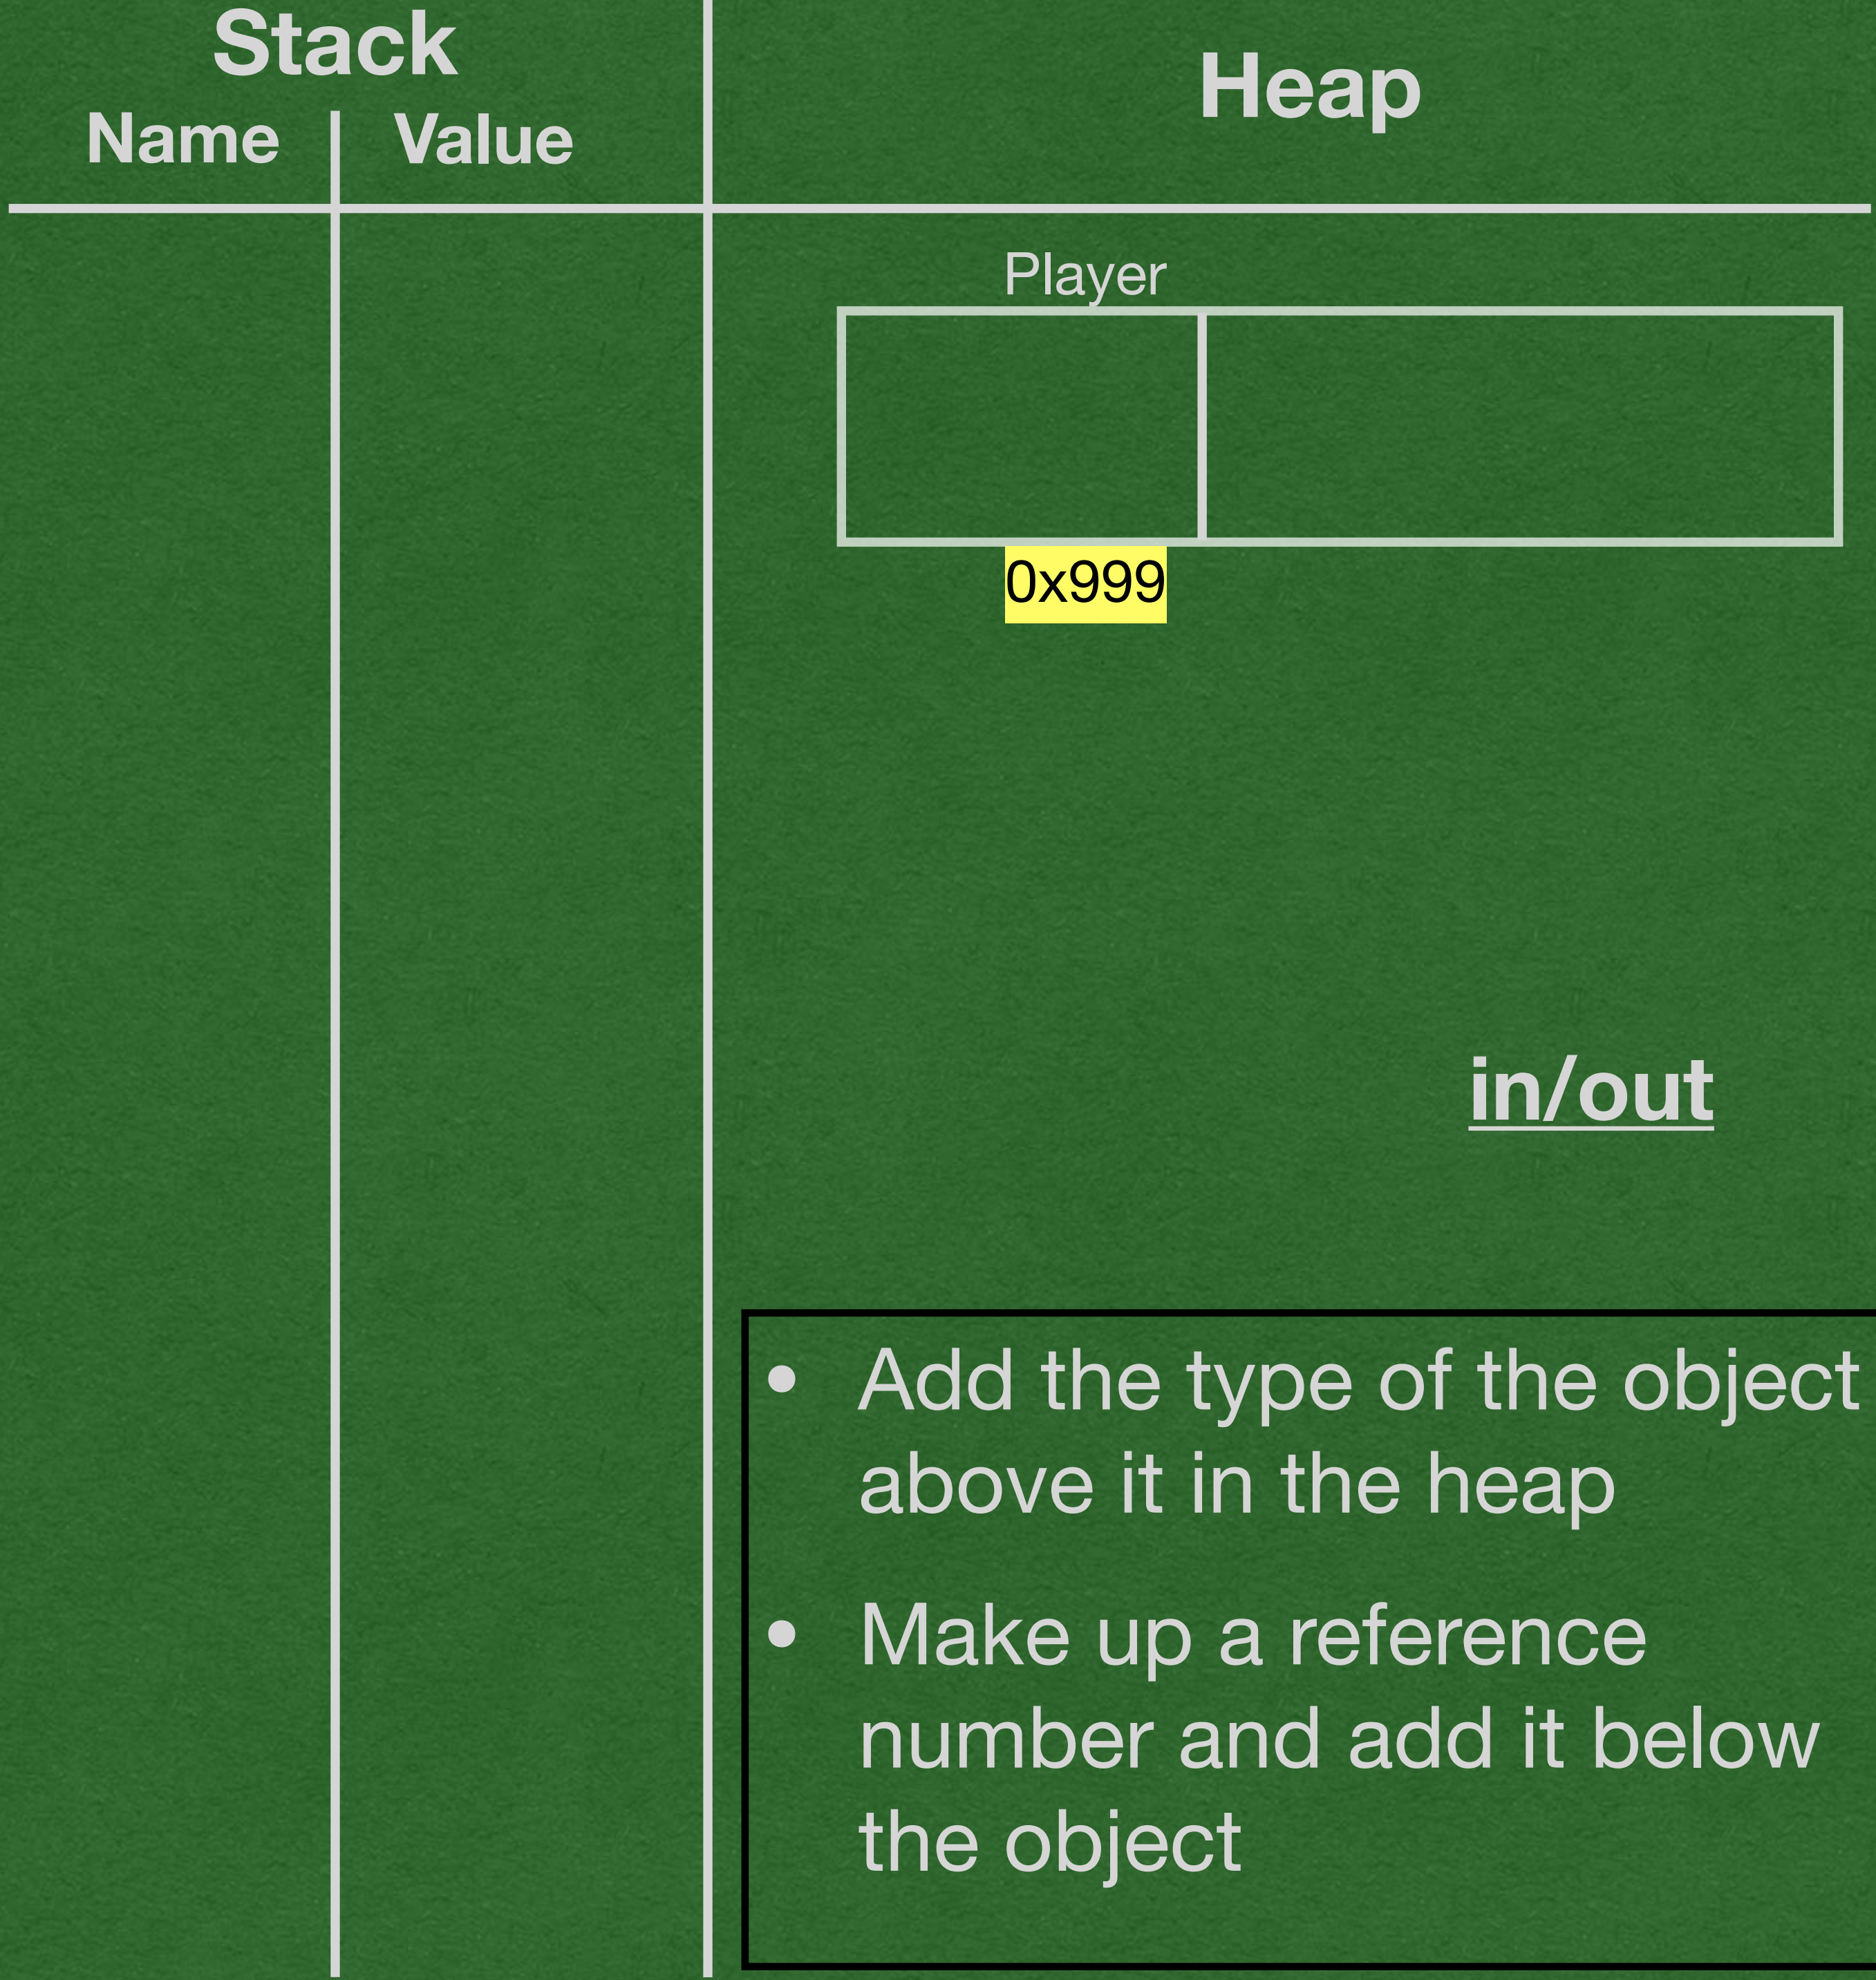

Stack

Player

0x999

in/out

- Add the type of the object above it in the heap

- Make up a reference number and add it below the object

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

in/out

- Create all the instance variables and add them to the object

- Each new object will have its own copies of each instance variable

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

in/out

- The constructor is a method

- Add it to the stack along with all of its parameters

- Constructors return a reference to the object that was created

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

➡️  public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

➡️  public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

Notation Note:

- I'll stop drawing reference arrows in slides to reduce clutter

- References will be color coded

- It's recommended that you use arrows on quizzes

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }

in/out

- All [non-static] methods have a "hidden" parameter of **this**

- For constructors, **this** stores a reference to the object that is being created

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

in/out

- Our constructor calls a setter method

- Methods contain a reference a reference to the calling object in **this**

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

in/out

- This method was called by **this** in the Player constructor stack frame which stores the reference 0x999

- 0x999 is the object that called setMaxHP so that stack frame's **this** stores 0x999

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}

in/out

- The setter method changes the value of a variable stored in the heap

- Follow the reference stored in **this** and set it's maxHP variable

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

Notation Note:

- I'll gray out a stack frame that is removed from the stack

- This will have the same meaning as crossing it out

- Makes the variables readable

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}

- Calling setHP will set the hp variable on the stack for this object

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());

in/out

- Whenever you see **new**, a new object is created on the heap

- We have 2 objects of type Player

  - Each object has its own copies of each instance variable

```java
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}
```

Paladin

- End Program

Stack Memory

- Only primitive types are stored directly on the stack

  - double

  - int

  - char

  - boolean

  - String*

  - Double/Integer/Character/Boolean*

- **Everything else** is stored on the heap with only their references stored on the stack**

  - This includes **every** object created from a class that **you wrote**

*Strings and boxed types are actually more complex, but we will treat them as though they are on the stack in this course because they *behave* exactly as a value on the stack

**Stack and heap allocations vary by compiler and JVM implementations. With modern optimizations, we can never be sure where our values will be stored
We'll use this simplified view so we can move on and learn Computer Science

toString

```java
package week3;

public class Player {

    private int maxHP;
    private int hp;
    private int attackPower = 4;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    /** Getters and Setters removed for slide **/

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        System.out.println(p1)
    }
}
```

week3.Player@279f2327

- When you print one of your objects to the screen

  - It prints garbage

- Fully qualified name

- @

- "random" hex value

- Almost always not what you want

toString

```java
package week3;

public class Player {

    private int maxHP;
    private int hp;
    private int attackPower = 4;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public String toString() {
        String out = "health: " + this.hp + "/";
        out += this.maxHP;
        return out;
    }

    /** Getters and Setters removed for slide **/

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        System.out.println(p1);
    }
}
```

health: 10/10

- If we write a special method named "toString" that returns a String

- This method will be called when we print an object of this type

Types

```java
public class Player {
    private int maxHP;
    private int hp;
    private int attackPower = 4;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public String toString() {
        String out = "health: " + this.hp + "/";
        out += this.maxHP;
        return out;
    }

    public void takeDamage(int damage) {
        this.hp -= damage;
    }

    public void attack(Player otherPlayer) {
        otherPlayer.takeDamage(this.attackPower);
    }

    /** Getters and Setters removed for slide **/

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p2;
        p1.attack(p2);
        p1.attack(p2);
    }
}
```

- Classes define types

- Now that we have a Player type, we can use it wherever we need a type

- Here, we use Player as the type of a method parameter

Party Example

Party

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }
    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}
```

- Let's look at another example

- We'll highlight 2 new concepts with this code:

  - Composition

  - Garbage Collection

Composition

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }
    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}
```

- Instance variables of objects can store references to the objects

- The Party class is composed of an ArrayList of Characters

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }
    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}
```

Garbage Collection

- hero is assigned a reference to an instance/object of type Character

- hero is then reassigned to a new reference

- We no longer have a reference to the first Character object in memory

  - Since we cannot access this object, it will be removed from memory

Memory Diagram

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```

Stack

battlesWon	0
expPoints	0

0x875

in/out

- Start by creating a new Character object

- The constructor is empty, but we still create the instance variables

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```
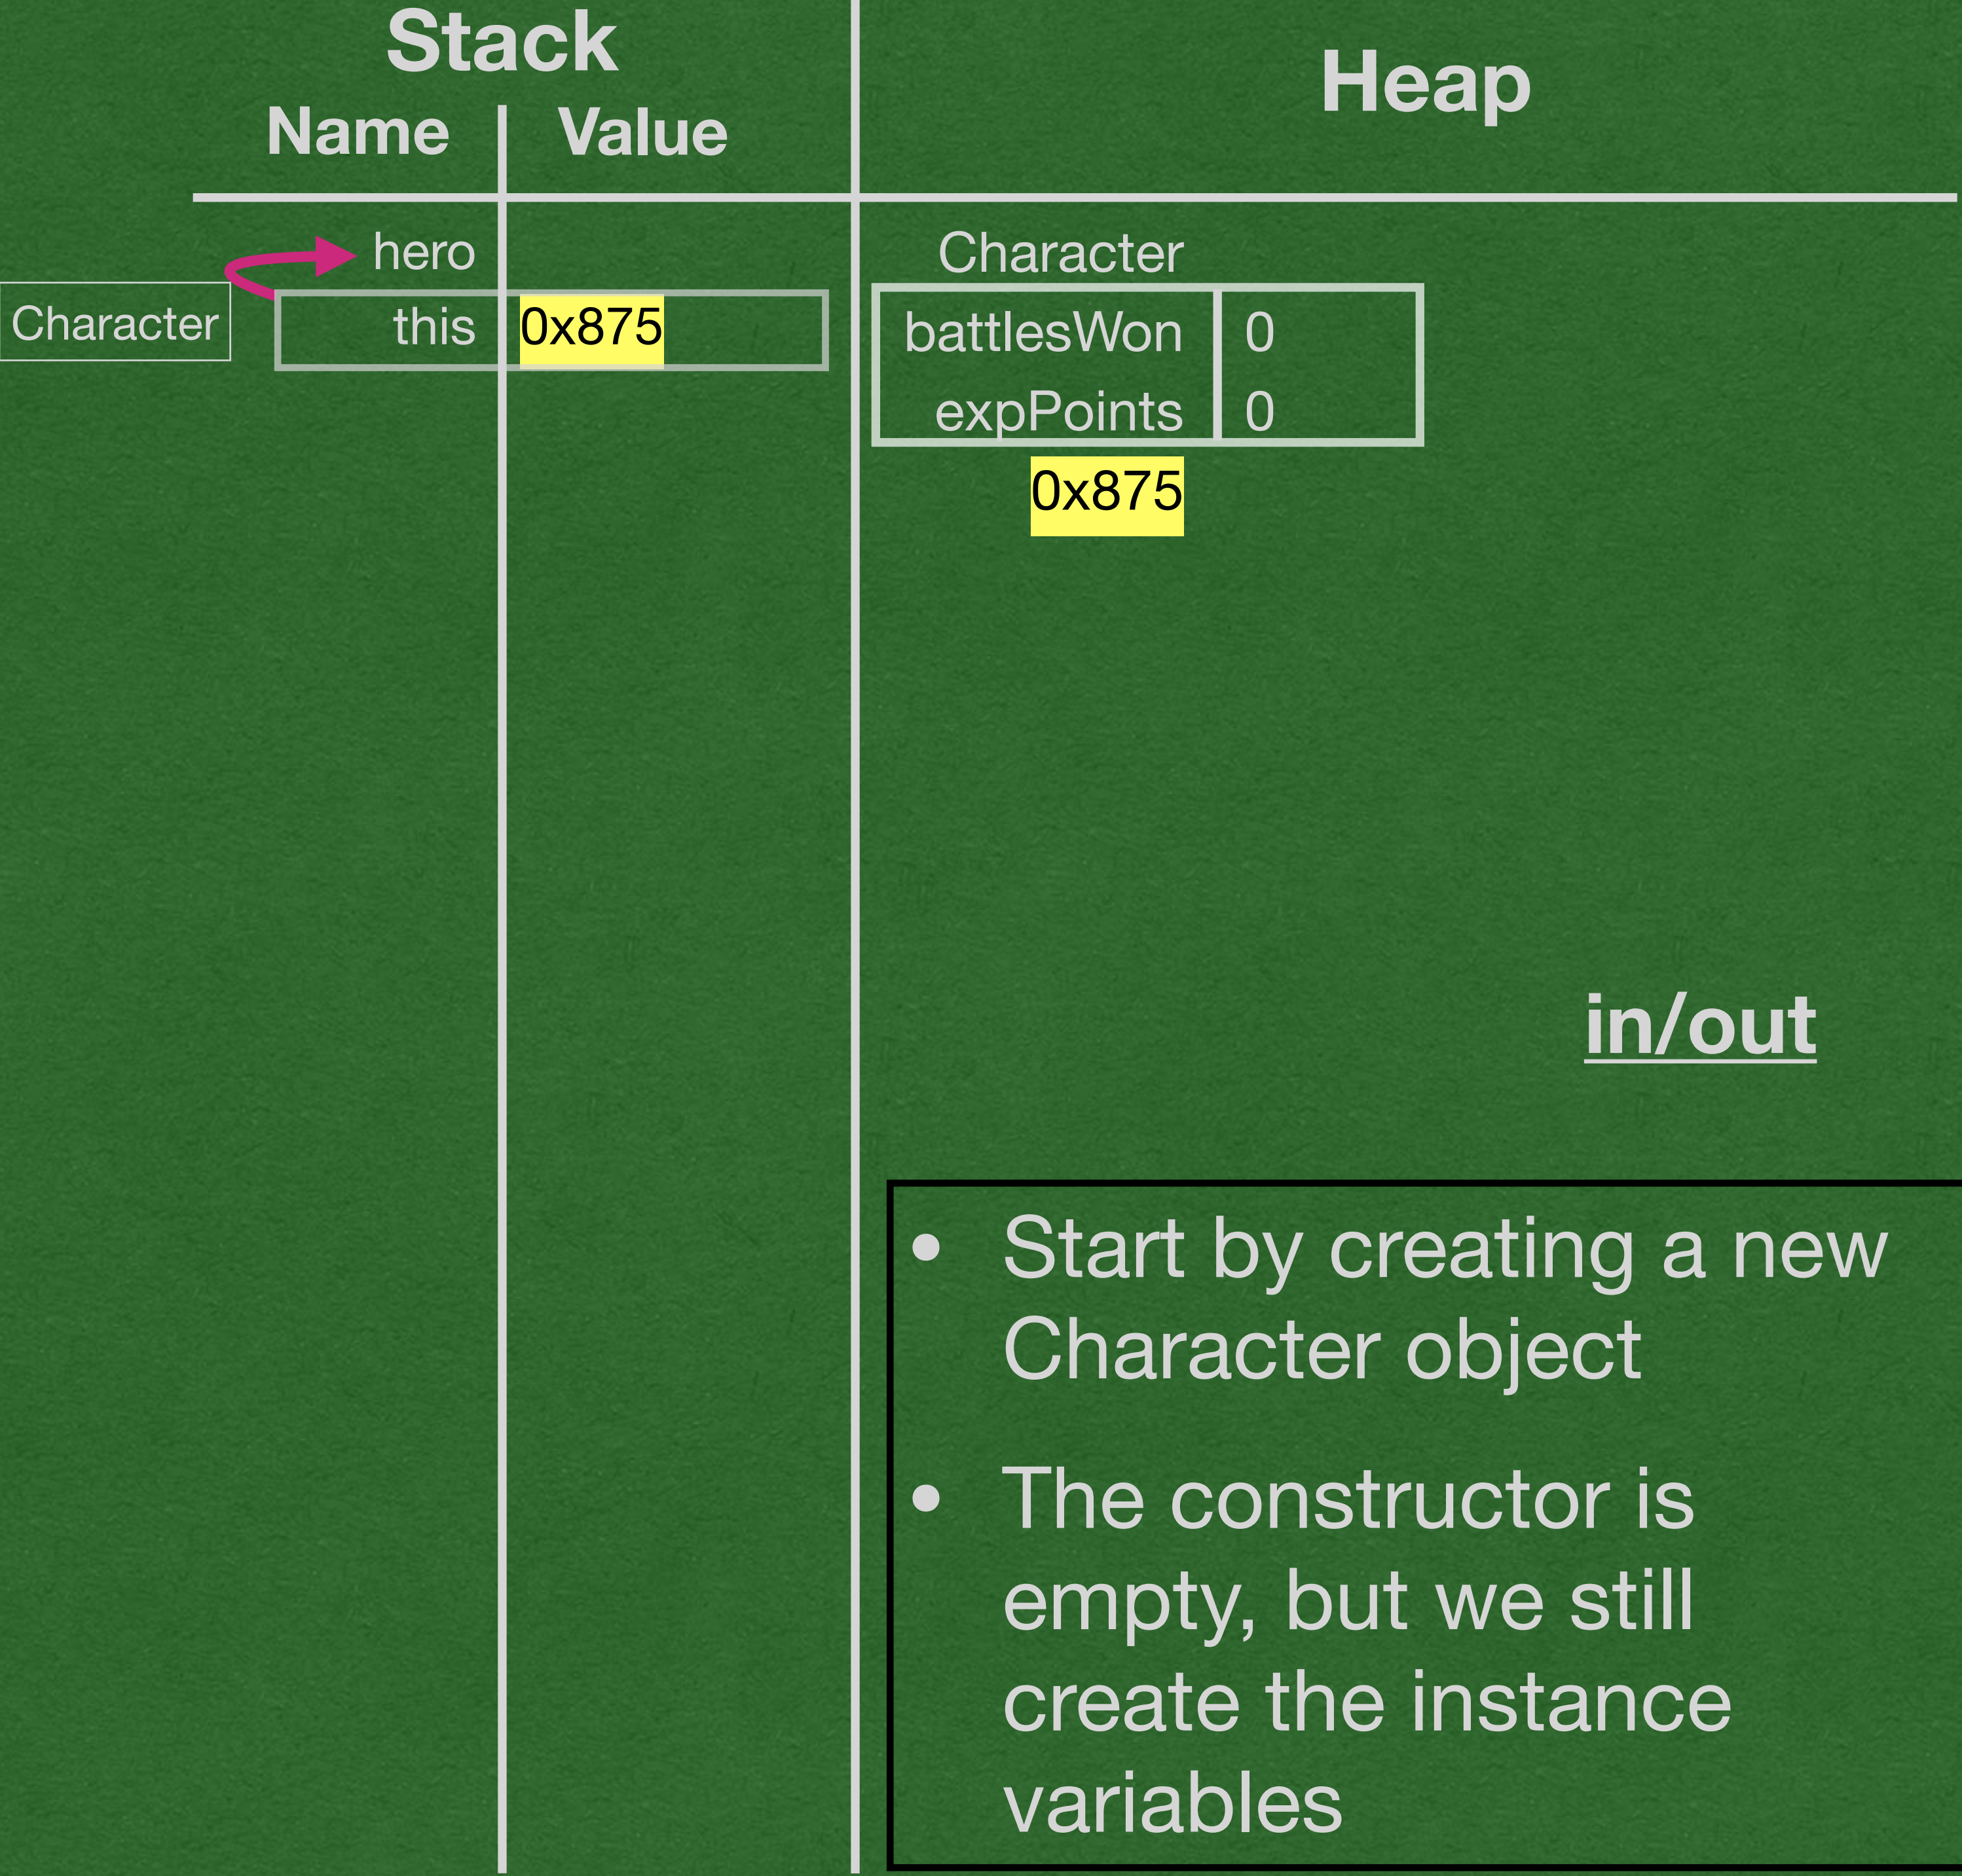

Stack

Heap

Name	Value
hero	0x875 0x320
Character this	0x875
Character this	0x320

Character		Character	
battlesWon	0	battlesWon	0
expPoints	0	expPoints	0
0x875		0x320	

in/out

- We immediately replace the reference stored in hero with a reference to a new object

- *You wouldn't actually do this. This is only for the example

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```
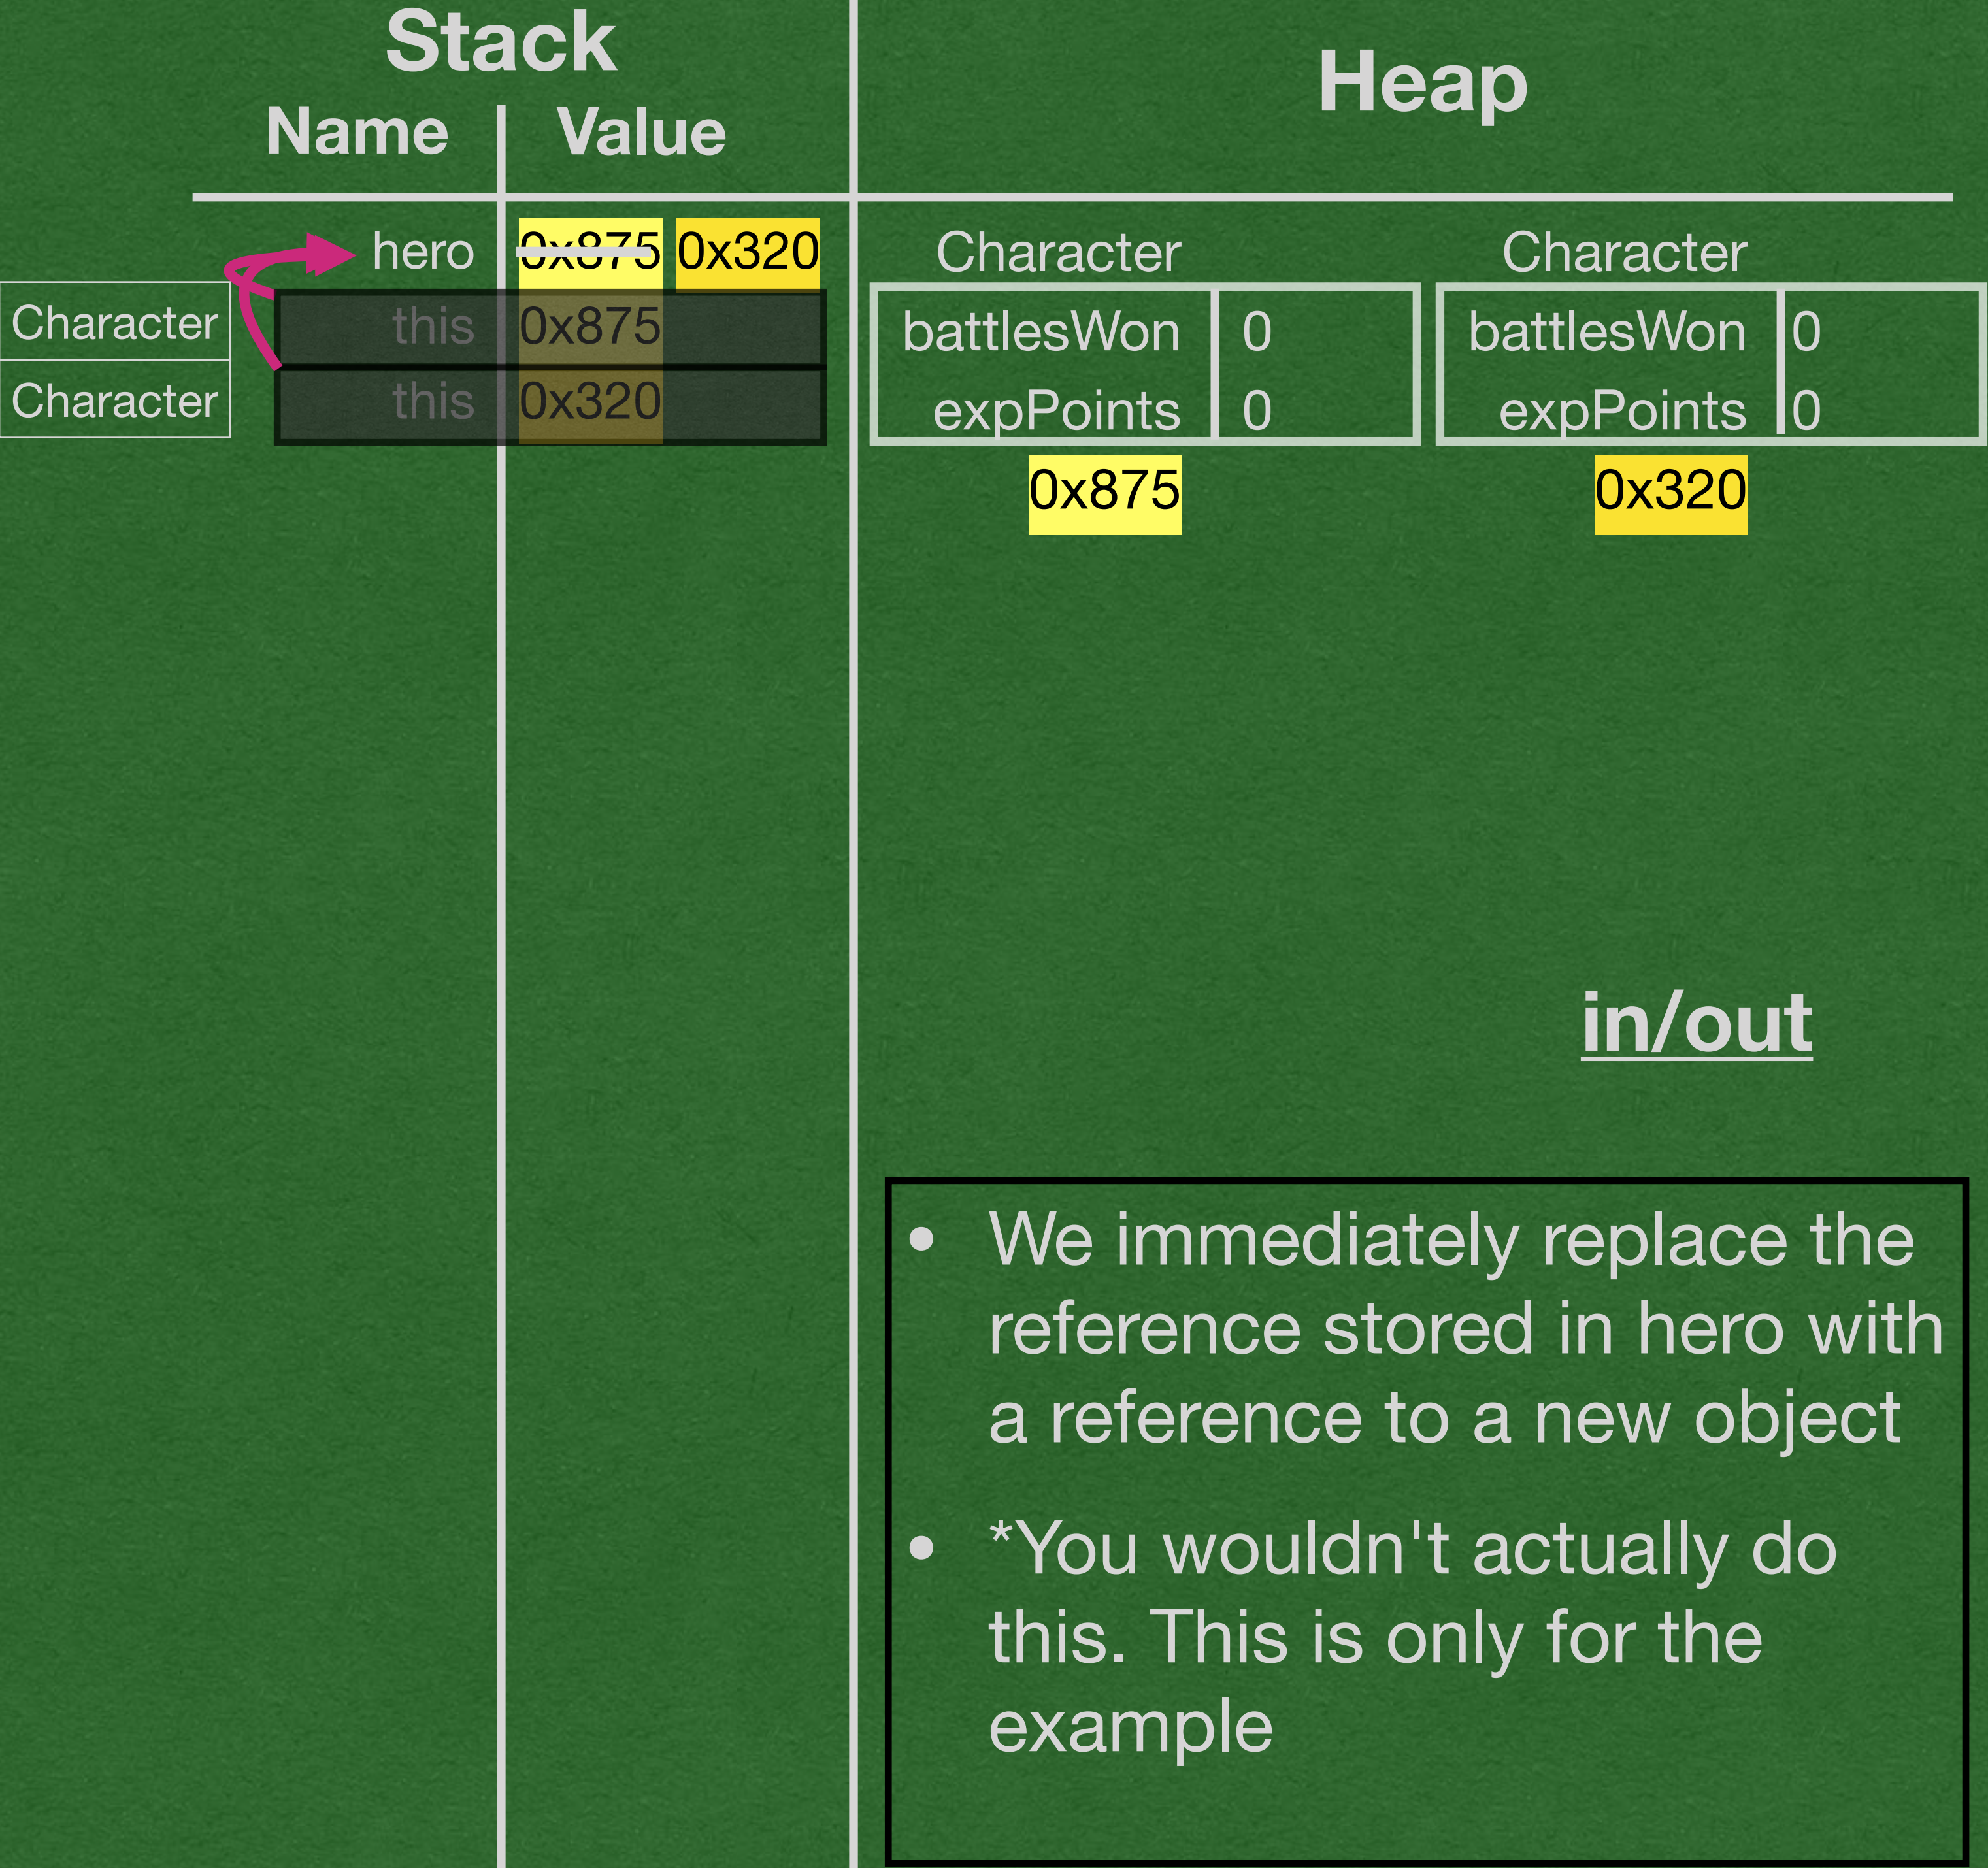

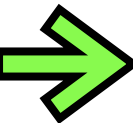

Stack

Name	Value
hero	0x875 0x320
Character this	0x875
Character this	0x320

Heap

Character		Character	
battlesWon	0	battlesWon	0
expPoints	0	expPoints	0
0x875		0x320	

in/out

Garbage Collection

- When we no longer have access to a reference to an object on the heap, it is deleted from memory

- Java does this in the background as we reassign variables

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```
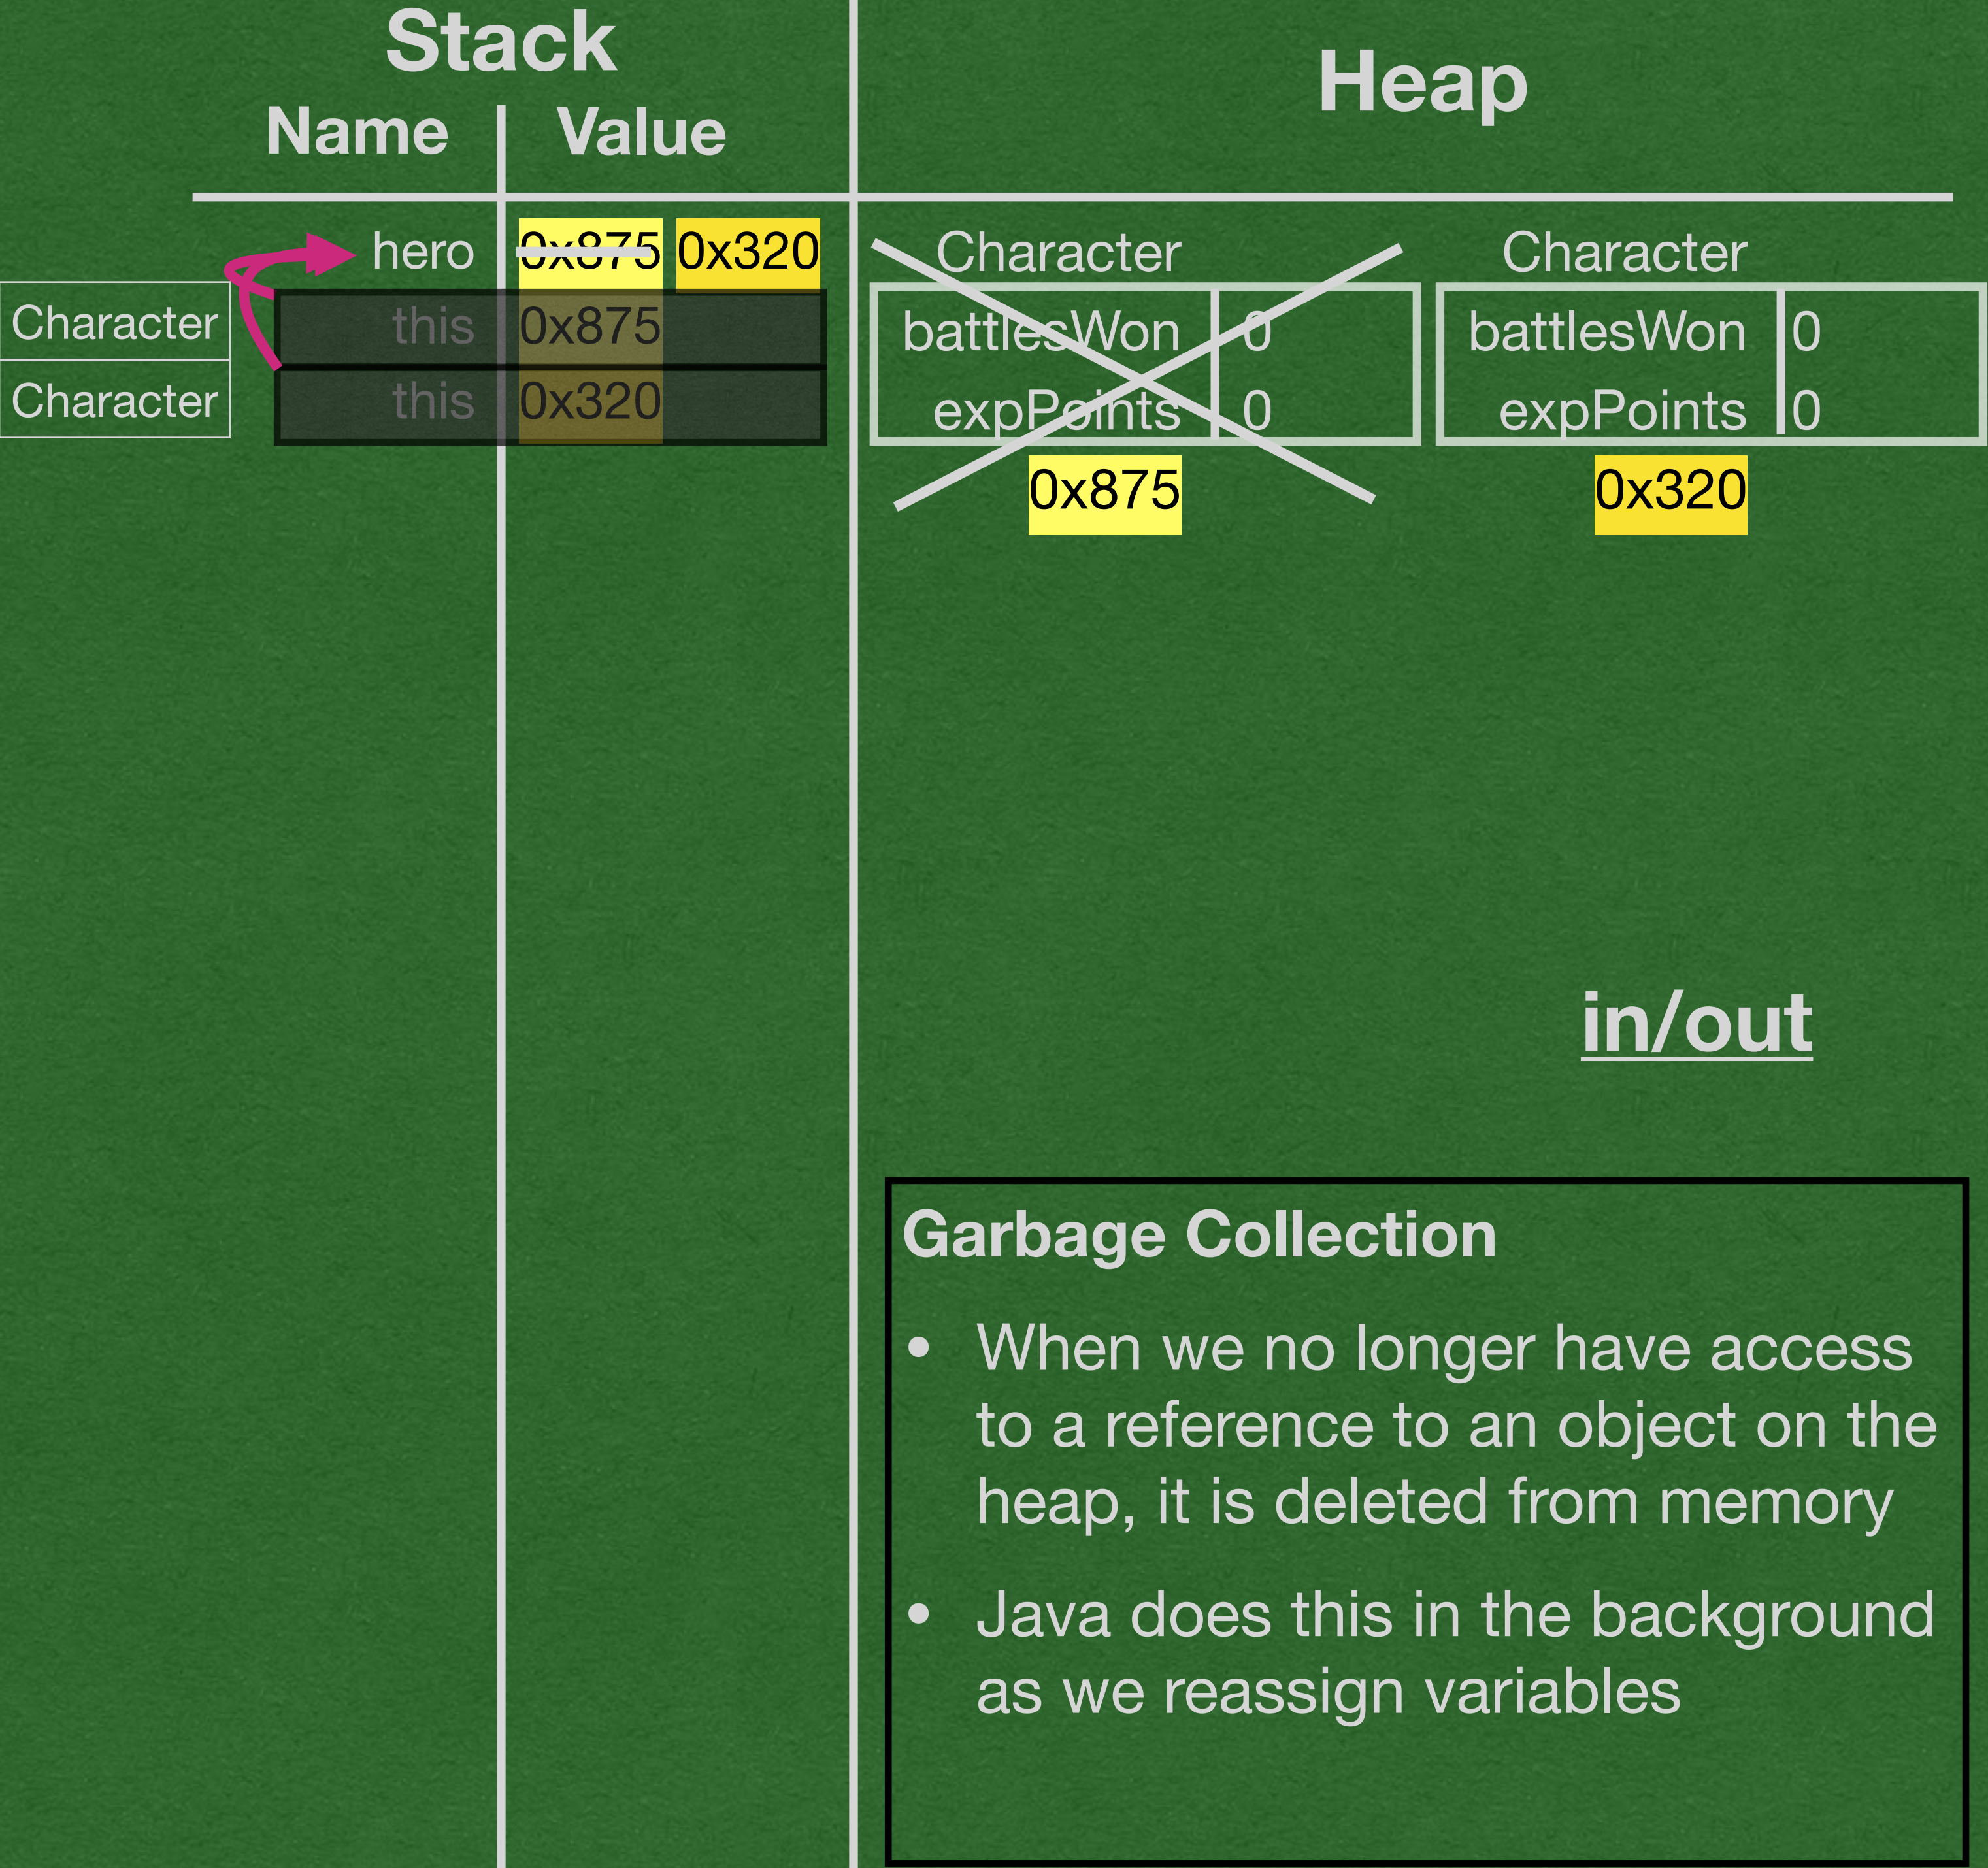

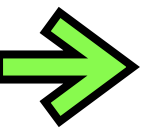

Stack

Name	Value
hero	0x875 0x320
Character this	0x875
Character this	0x320
fighter	0x555
Character this	0x555

Heap

Character
| battlesWon | 0 |
| expPoints | 0 |
0x875

Character
| battlesWon | 0 |
| expPoints | 0 |
0x320

Character
| battlesWon | 0 |
| expPoints | 0 |
0x555

in/out

- Create another instance of the Character class (Object of type character)

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```
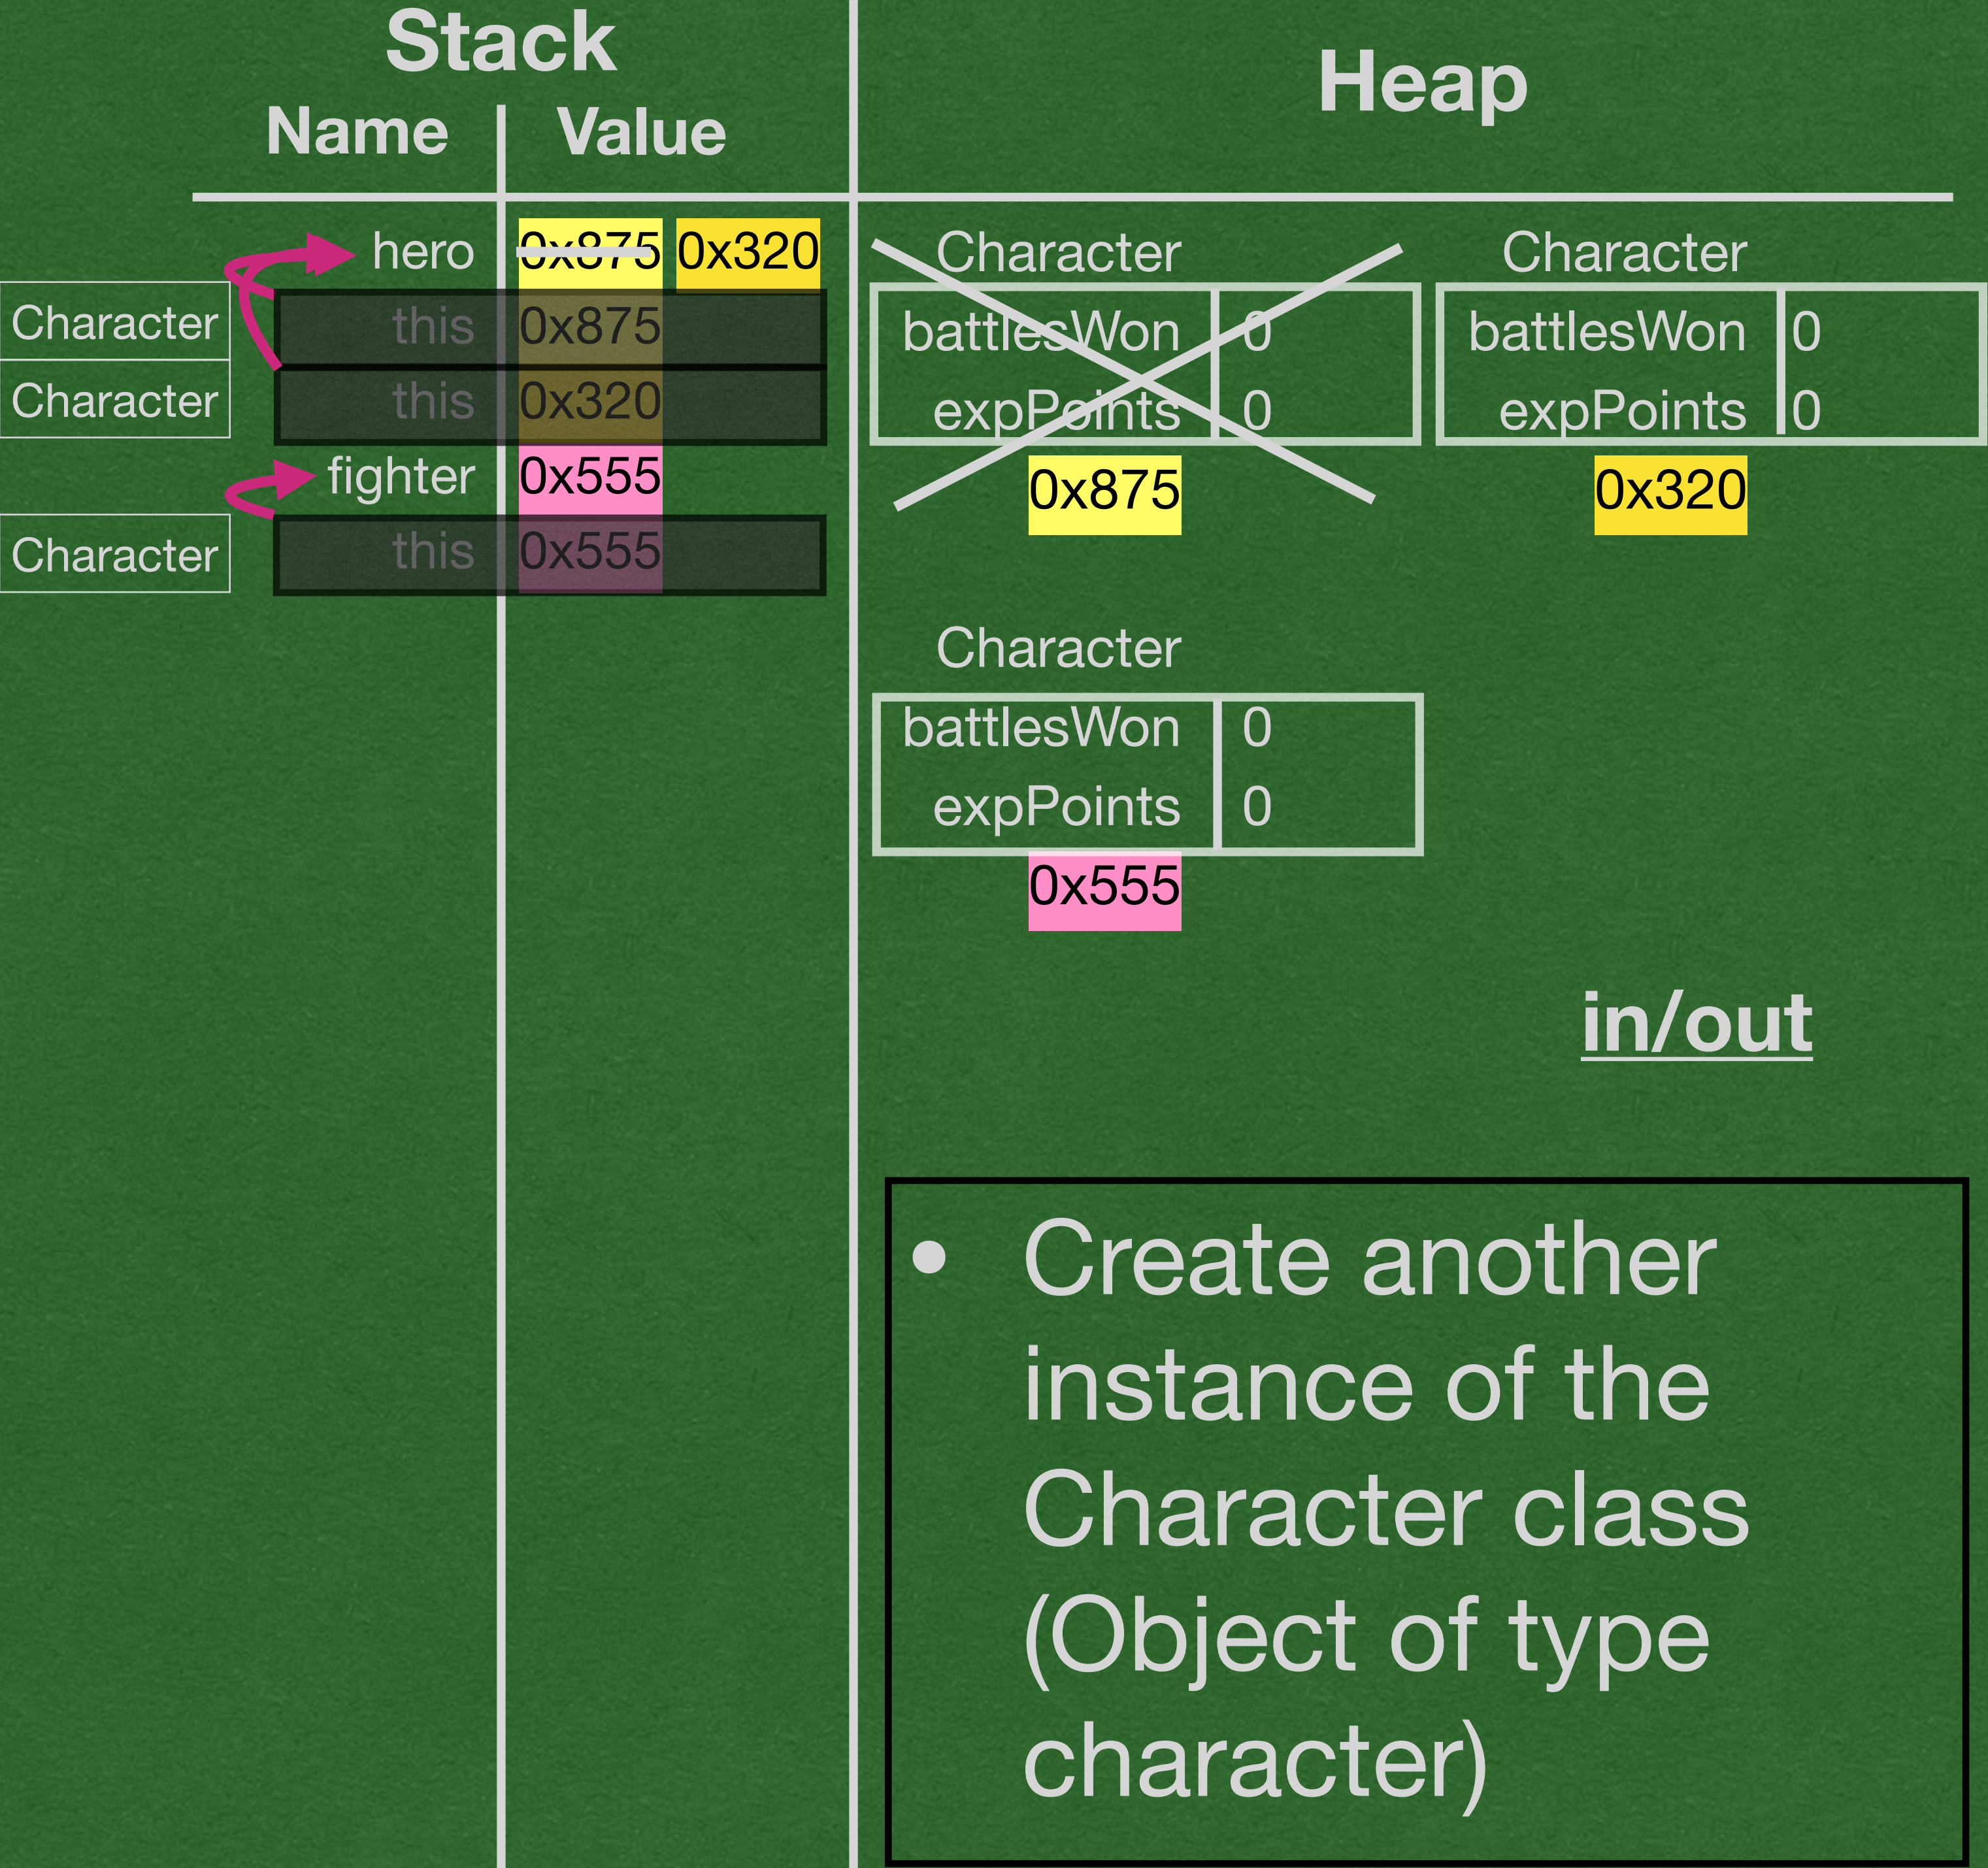

Stack

Name	Value
hero	0x875 0x320
Character — this	0x875
Character — this	0x320
fighter	0x555
Character — this	0x555
this	0x320
winBattle — xp	10

Heap

Character		Character	
battlesWon	0	battlesWon	0
expPoints	0	expPoints	0

0x875   0x320

Character	
battlesWon	0
expPoints	0

0x555

in/out

- When we call a method:
  - *this* is added to the stack frame
  - *this* stores reference to the calling object

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }
    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}
```
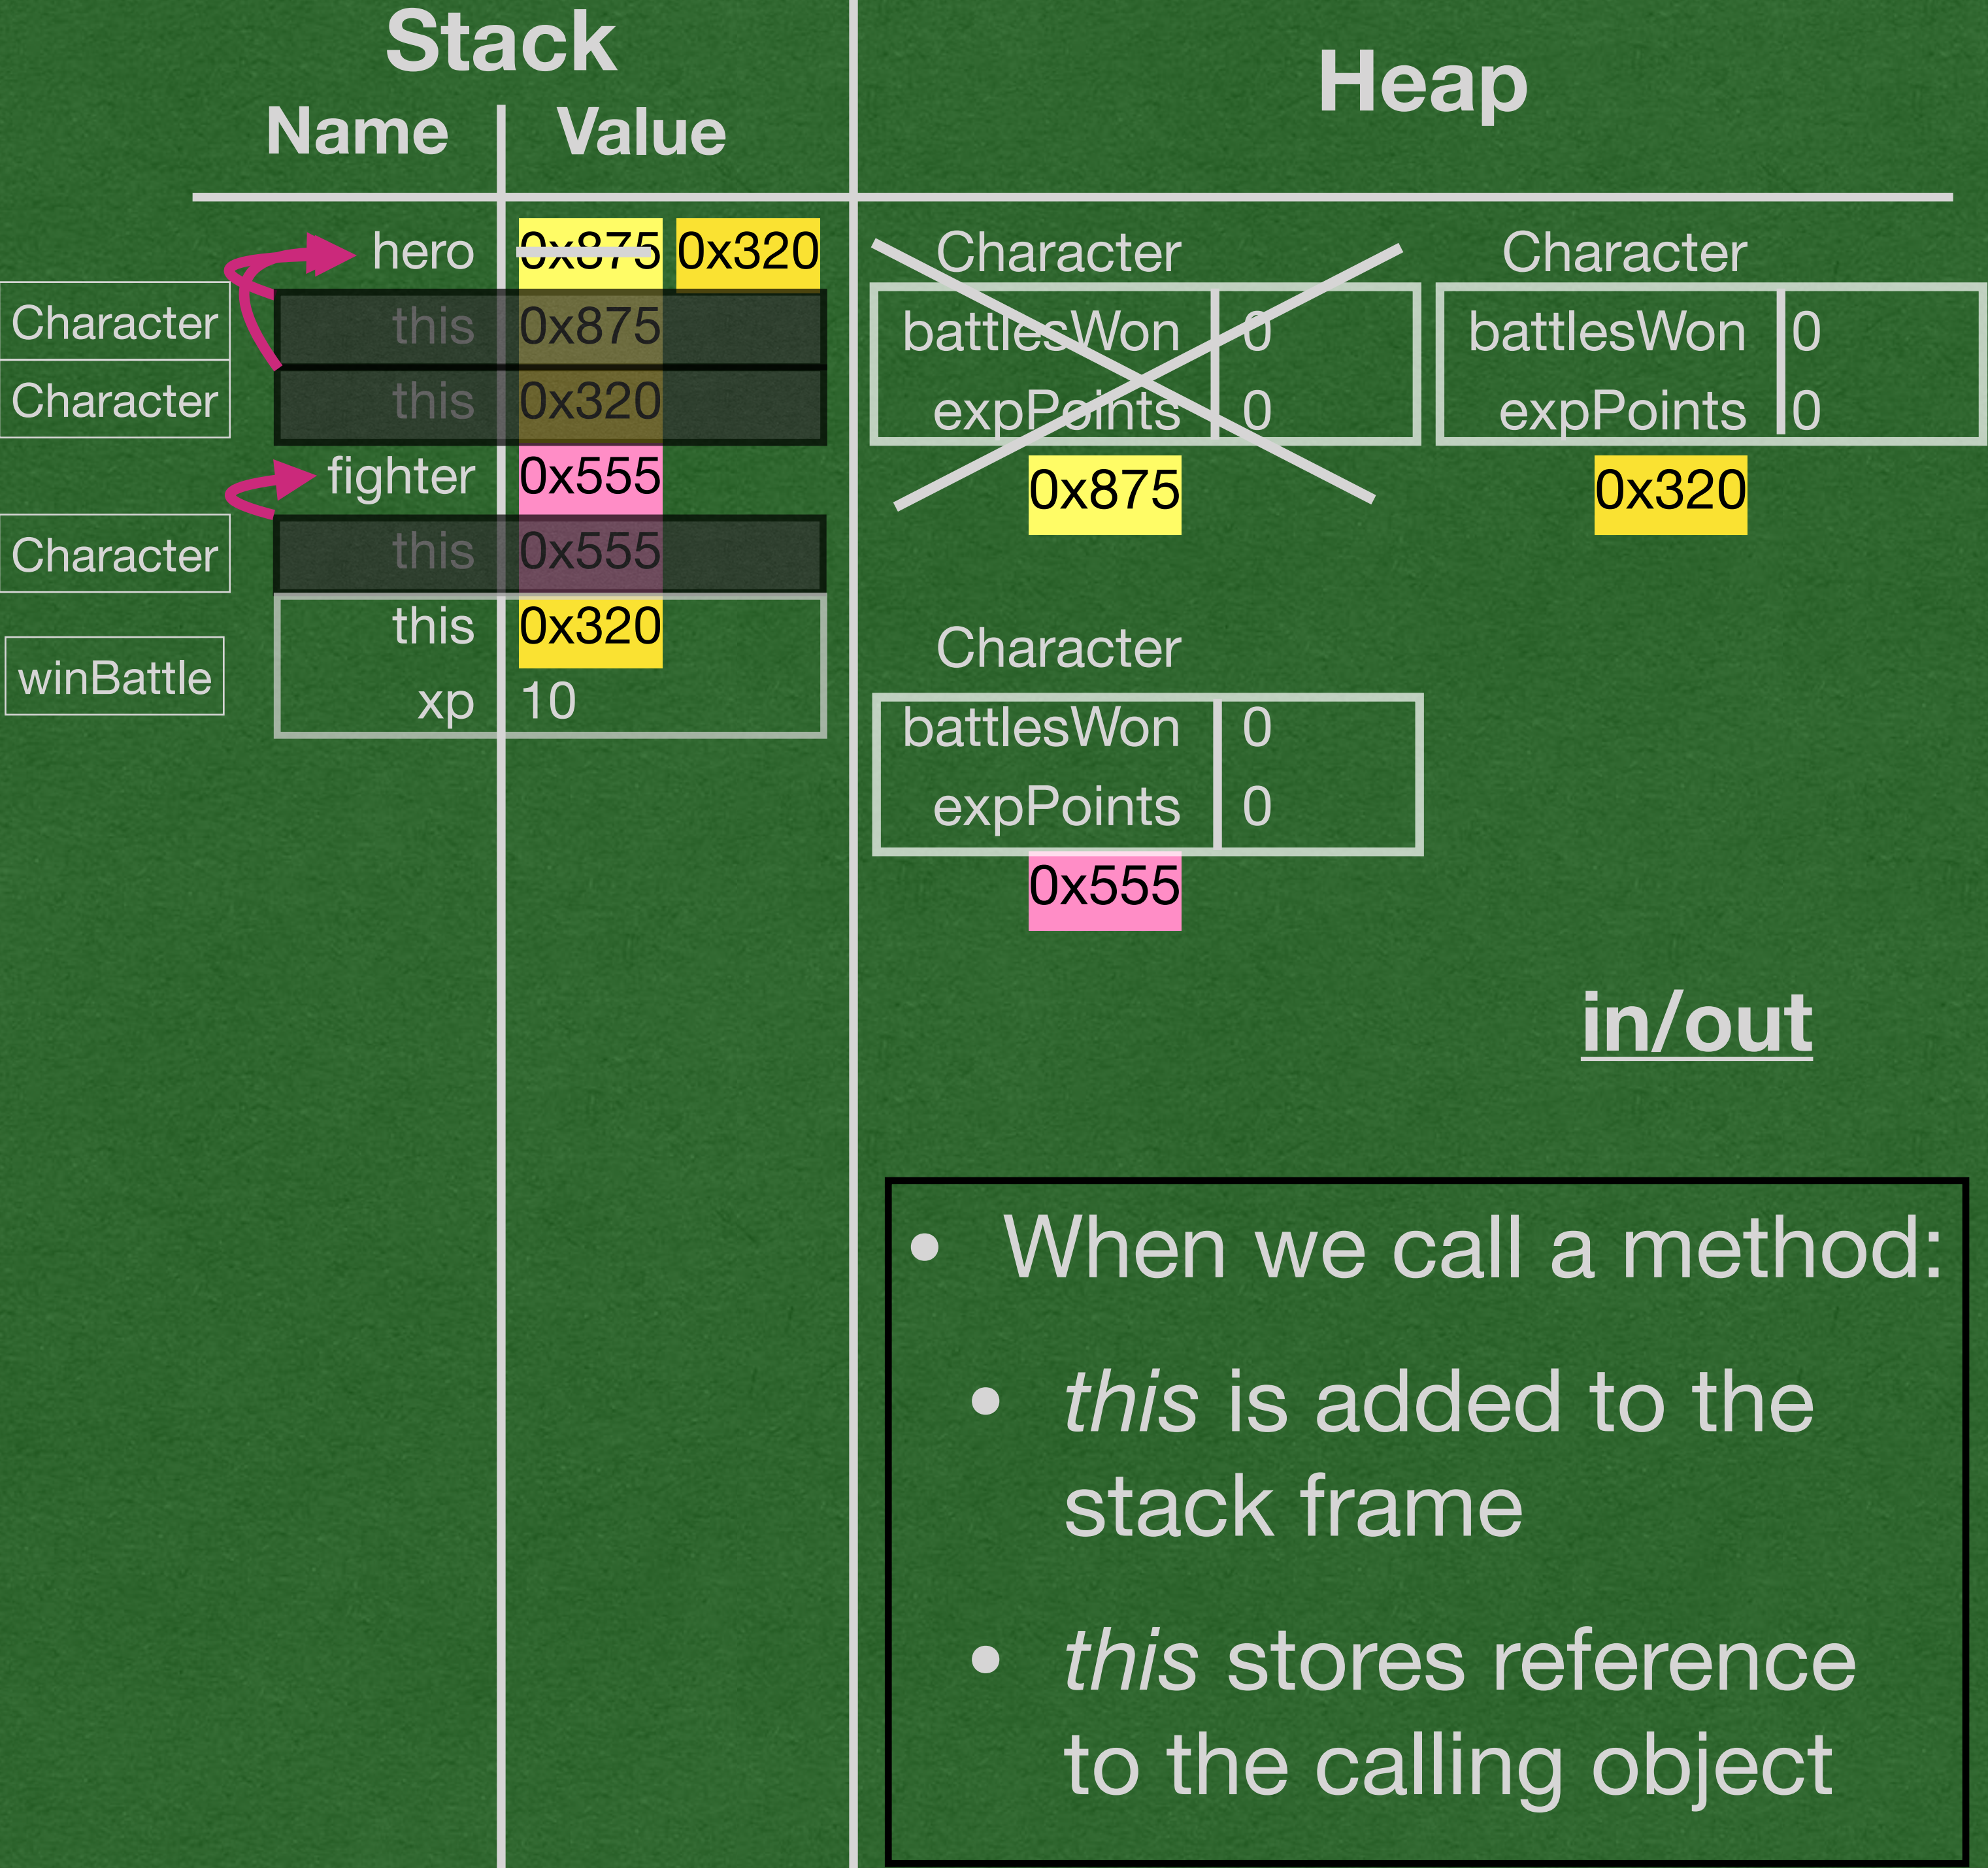

Stack

Name	Value
hero	0x875 0x320

Character
| battlesWon | 0 |
| expPoints | 0 |
0x320

Character
| battlesWon | 0 |
| expPoints | 0 |
0x555

in/out

- winBattle was called by hero

- hero stores the reference 0x320

- this in the stack frame is 0x320

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```

in/out

- Follow the reference stored in *this* to update the instance variables

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}

in/out

- This method's got side-effects!

- winBattle returns void

- winBattle was called to change the state of an object on the heap

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }

    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}

0x313

in/out

- When we create a new Party, we also create a new ArrayList via composition

- Both objects are created on the heap

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
      this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
      this.members.add(member);
    }
    public void winBattle(int xp) {
      this.battlesWon++;
      for (int x=0; x < this.members.size(); x++) {
        this.members.get(x).winBattle(xp);
      }
    }
    public static void main(String[] args) {
      Character hero = new Character();
      hero = new Character();
      Character fighter = new Character();
      hero.winBattle(10);
      Party party = new Party();
      party.addCharacter(hero);
      party.addCharacter(fighter);
      party.winBattle(20);
    }
}
```

0x313

in/out

- The is a stack frame created for the ArrayList constructor

- When the code is part of Java, and not our code, we don't add it to the memory diagram

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
    private ArrayList<Character> members;
    private int battlesWon = 0;

    public Party() {
        this.members = new ArrayList<>();
    }
    public void addCharacter(Character member) {
        this.members.add(member);
    }
    public void winBattle(int xp) {
        this.battlesWon++;
        for (int x=0; x < this.members.size(); x++) {
            this.members.get(x).winBattle(xp);
        }
    }
    public static void main(String[] args) {
        Character hero = new Character();
        hero = new Character();
        Character fighter = new Character();
        hero.winBattle(10);
        Party party = new Party();
        party.addCharacter(hero);
        party.addCharacter(fighter);
        party.winBattle(20);
    }
}
```
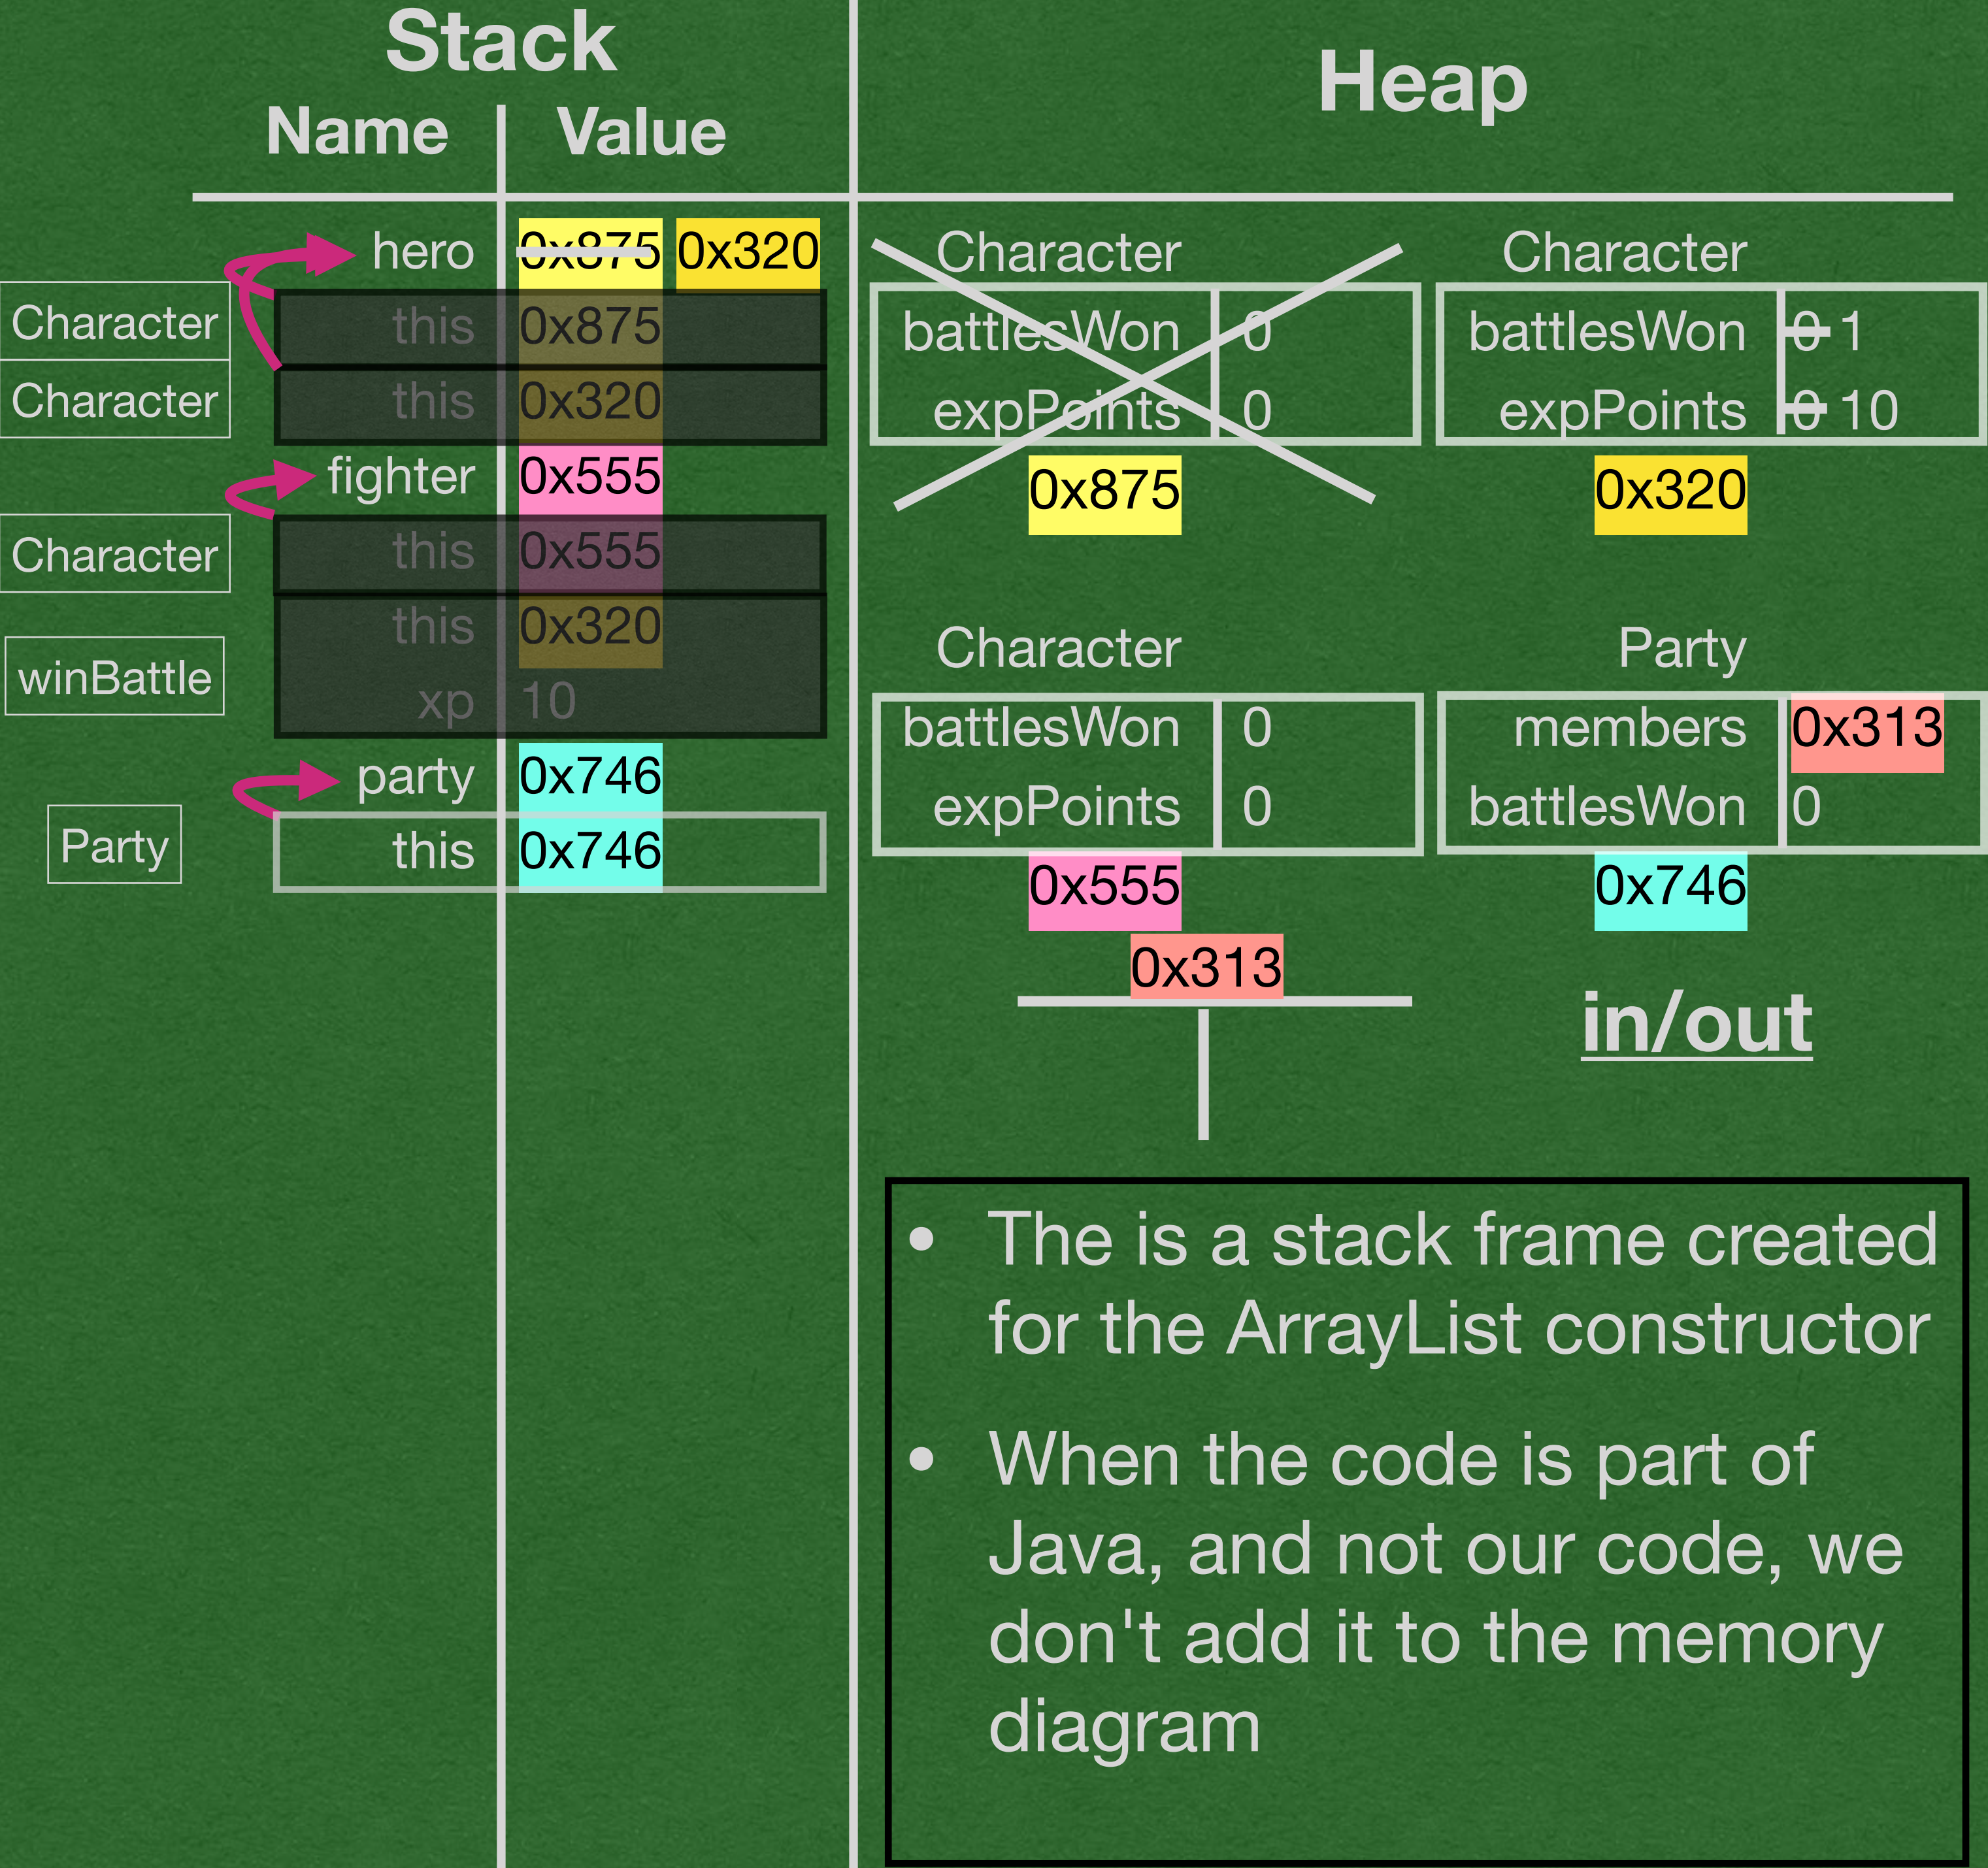

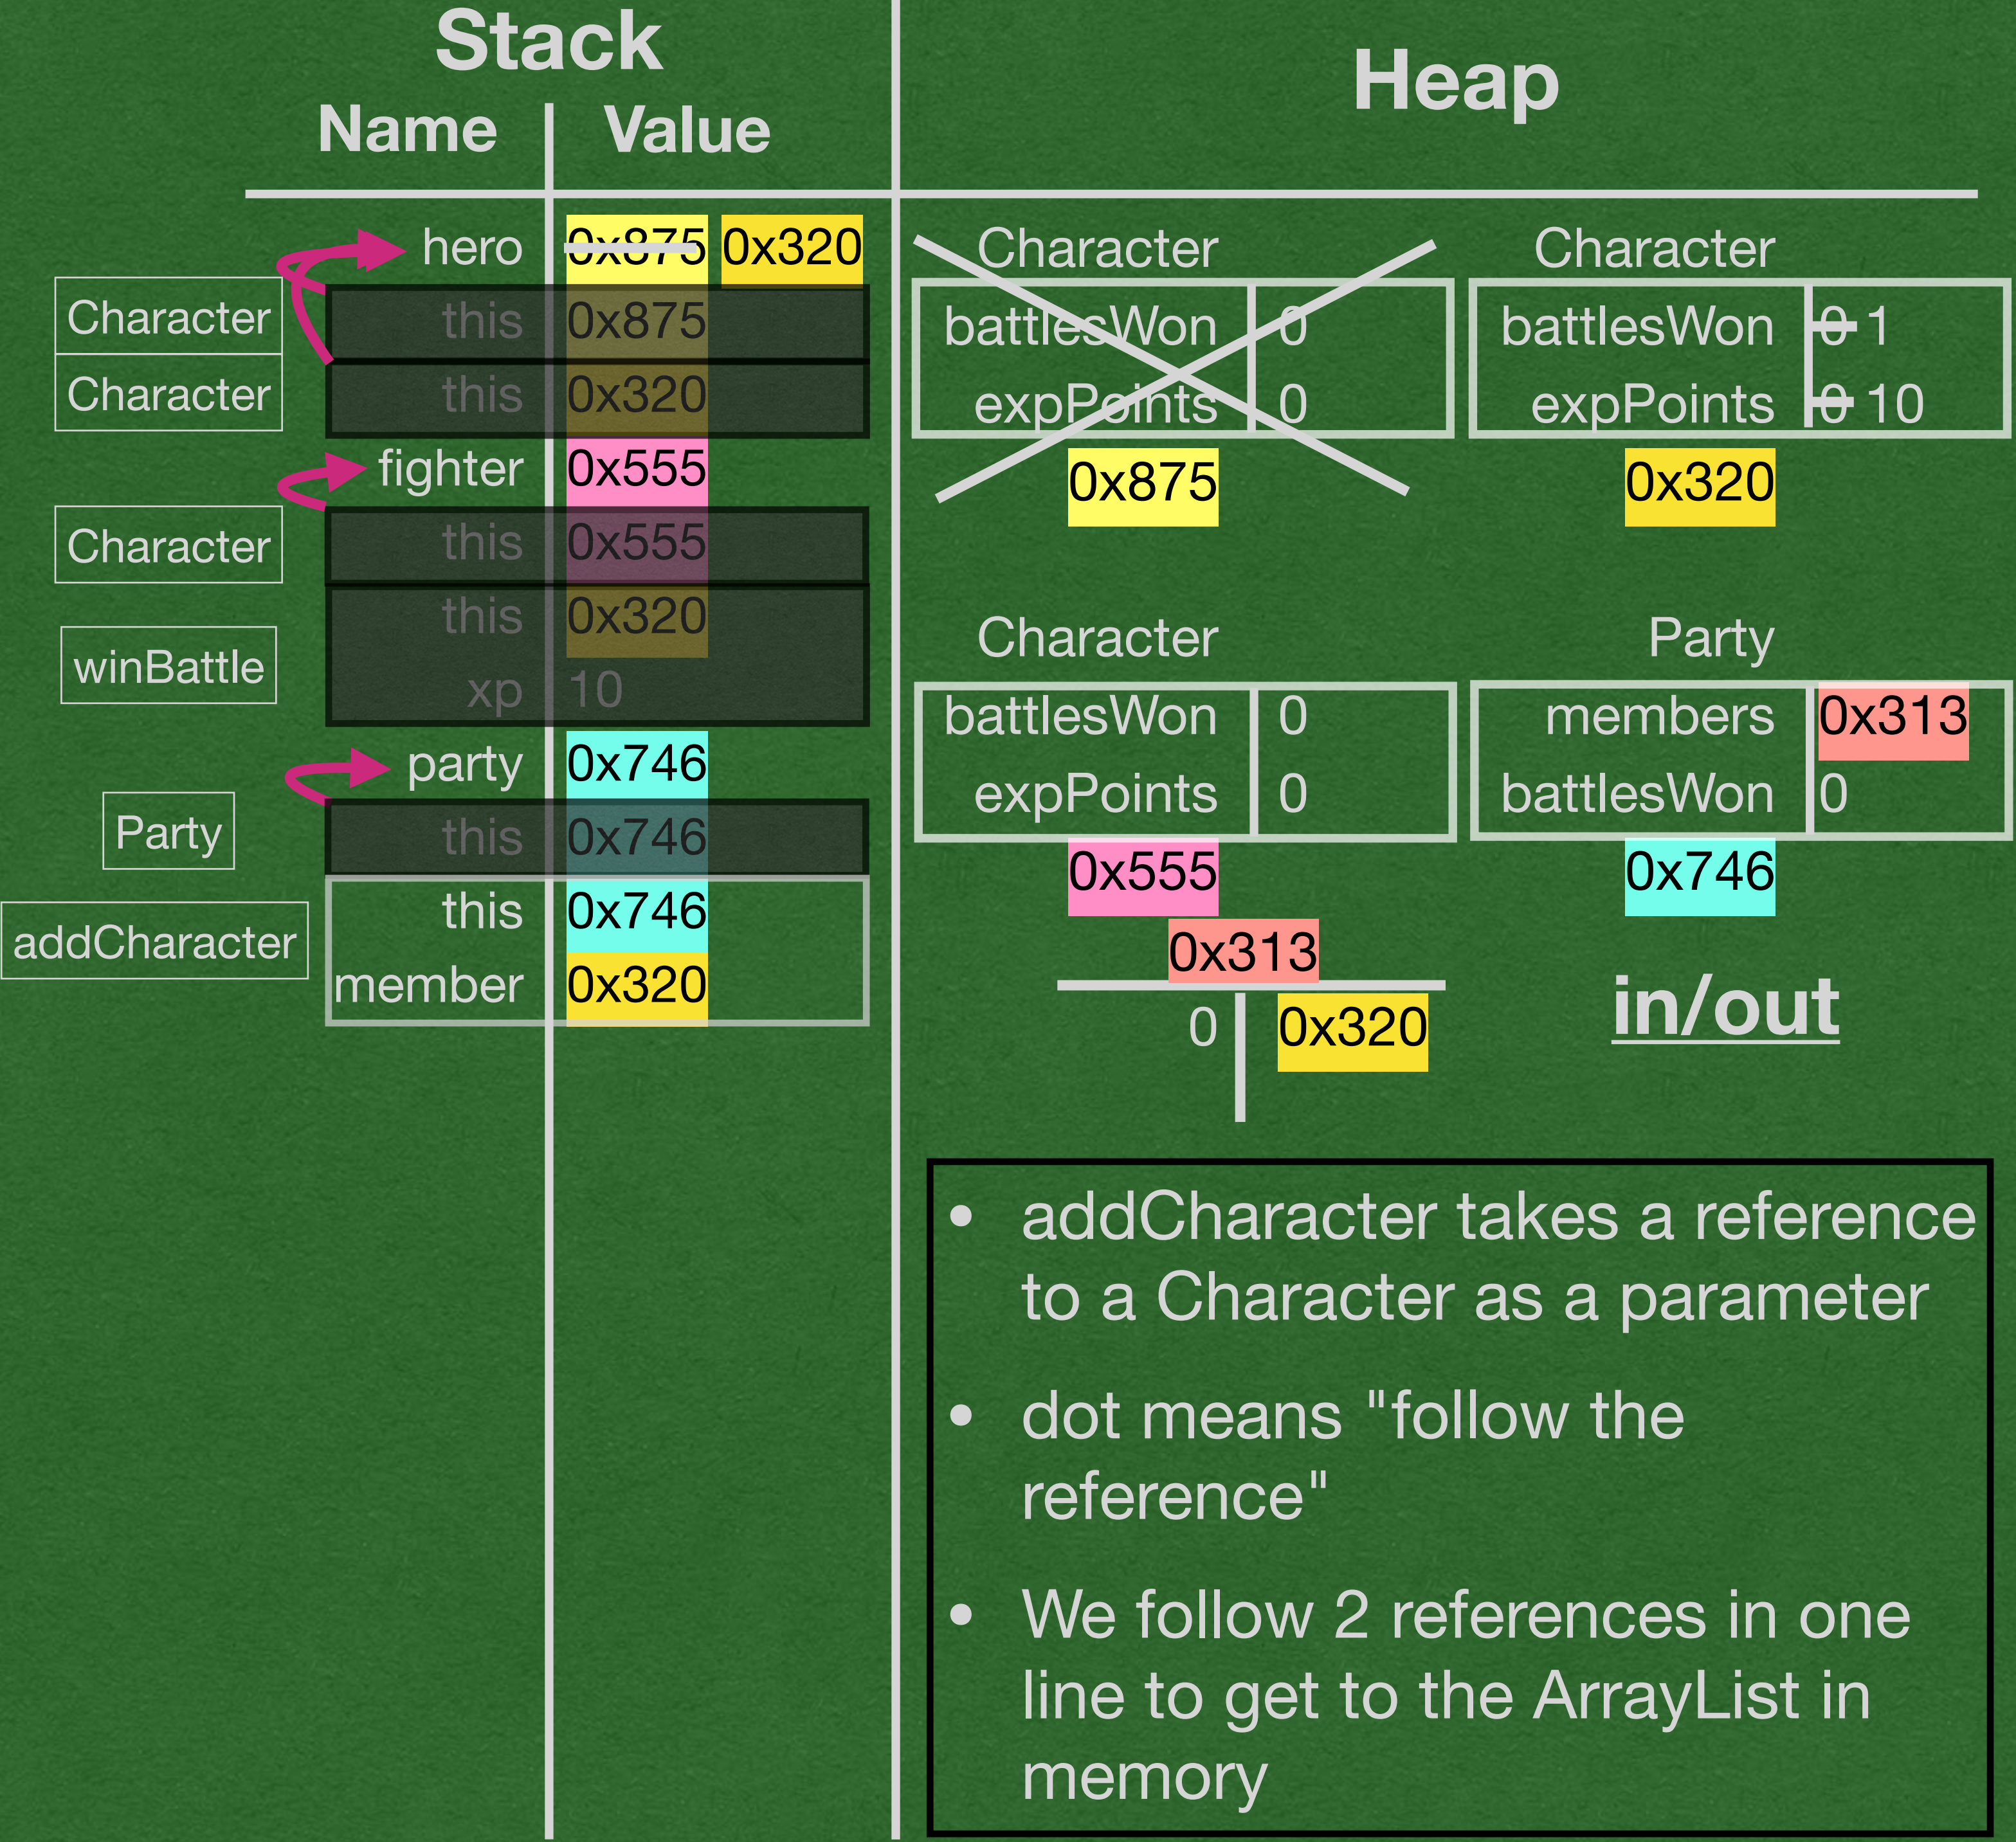

Stack

in/out

- addCharacter takes a reference to a Character as a parameter

- dot means "follow the reference"

- We follow 2 references in one line to get to the ArrayList in memory

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
    this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }
  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
    hero.winBattle(10);
    Party party = new Party();
    party.addCharacter(hero);
    party.addCharacter(fighter);
    party.winBattle(20);
  }
}
```

- Since we were at 0x320 in memory when this method is called

  - 0x320 is the calling object

  - *this* stores 0x320

```java
public class Character {
    private int battlesWon = 0;
    private int expPoints = 0;

    public Character() {}
    public void winBattle(int xp) {
        this.battlesWon++;
        this.expPoints += xp;
    }
}
```

```java
public class Party {
  private ArrayList<Character> members;
  private int battlesWon = 0;

  public Party() {
   this.members = new ArrayList<>();
  }
  public void addCharacter(Character member) {
    this.members.add(member);
  }
  public void winBattle(int xp) {
    this.battlesWon++;
    for (int x=0; x < this.members.size(); x++) {
      this.members.get(x).winBattle(xp);
    }
  }

  public static void main(String[] args) {
    Character hero = new Character();
    hero = new Character();
    Character fighter = new Character();
